24405 (UCRL-JC–118762) **Use of the AIC with the EM algorithm: A demonstration of a probability model selection technique.** Glosup, J.G.; Axelrod, M.C. Lawrence Livermore National Lab., CA (United States). 12 Aug 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9408107–6: American Statistical Association, Toronto (Canada), 14-18 Aug 1994). Order Number DE95014156. Source: OSTI; NTIS; GPO Dep.

The problem of discriminating between two potential probability models, a Gaussian distribution and a mixture of Gaussian distributions, is considered. The focus of interest is a case where the models are potentially non-nested and the parameters of the mixture model are estimated through the EM algorithm. The AIC, which is frequently used as a criterion for discriminating between non-nested models, is modified to work with the EM algorithm and is shown to provide a model selection tool for this situation. A particular problem involving an infinite mixture distribution known as Middleton's Class A model is used to demonstrate the effectiveness and limitations of this method. The problem involves a probability model for underwater noise due to distant shipping.

The Enhanced Logistics Intra-Theater Support Tool (ELIST) is a simulation-based decision support system that evaluates a military deployment plan at the theater level for transportation and logistical feasibility. ELIST includes a discrete-event, time-stepped simulation kernel written in C, an object-oriented database written in Prolog, and a set of knowledge-bases that describe various operations, such as throughput capacity of ports, based on the attributes of the relevant objects. In the course of its development, ELIST has been used to support various planning activities.

24407 (CONF-950232–36) **Robotic conveyance of artillery projectiles for remote ammunition resupply operations.** Ray, T.L.; Glassell, R.L. Oak Ridge National Lab., TN (United States). [1995]. 15p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. American Nuclear Society meeting on robotics and remote systems; Monterey, CA (United States); 5-10 Feb 1995. Order Number DE95014288. Source: OSTI; NTIS; GPO Dep.

The U.S. Army's Project Manager, Advanced Field Artillery System/Future Armored Resupply Vehicle has given Oak Ridge National Laboratory the task of developing a robotic conveyance system which will provide automated artillery ammunition transfer. This technology is currently being developed and will be demonstrated in the summer of 1995. This paper describes the development of an ammunition transfer arm to date. The arm consists of three sections and 6 D.F. which will allow the Future Armored Resupply Vehicle to dock and mate with the Advanced Field Artillery System on terrain varying from $\pm 10°$ in pitch, yaw, and roll and will allow for alignment of the fuel and propellant transfer ports. This arm will deliver the ammunition to the AFAS, where it will be received by an automatic handling and storage system inside the AFAS.

24408 (CONF-9503164–3) **Levelized cost-benefit analysis of proposed diagnostics for the Ammunition Transfer Arm of the US Army's Future Armored Resupply Vehicle.** Wilkinson, V.K.; Young, J.M. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Agreement 1892-A078-A1. From 6. annual tank automotives command (TACOM) combat vehicle survivability symposium; Monterey, CA (United States); 28-30 Mar 1995. Order Number DE95013972. Source: OSTI; NTIS; GPO Dep.

The US Army's Project Manager, Advanced Field Artillery System/Future Armored Resupply Vehicle (PM-AFAS/FARV) is sponsoring the development of technologies that can be applied to the resupply vehicle for the Advanced Field Artillery System. The Engineering Technology Division of the Oak Ridge National Laboratory has proposed adding diagnostics/prognostics systems to four components of the Ammunition Transfer Arm of this vehicle, and a cost-benefit analysis was performed on the diagnostics/prognostics to show the potential savings that may be gained by incorporating these systems onto the vehicle. Possible savings could be in the form of reduced downtime, less unexpected or unnecessary maintenance, fewer regular maintenance checks. and/or tower collateral damage or loss. The diagnostics/prognostics systems are used to (1) help determine component problems, (2) determine the condition of the components, and (3) estimate the remaining life of the monitored components. The four components on the arm that are targeted for diagnostics/prognostics are (1) the electromechanical brakes, (2) the linear actuators, (3) the wheel/roller bearings, and (4) the conveyor drive system. These would be monitored using electrical signature analysis, vibration analysis, or a combination of both. Annual failure rates for the four components were obtained along with specifications for vehicle costs, crews, number of missions, etc. Accident scenarios based on component failures were postulated, and event trees for these scenarios were constructed to estimate the annual loss of the resupply vehicle, crew, arm. or mission aborts. A levelized cost-benefit analysis was then performed to examine the costs of such failures, both with and without some level of failure reduction due to the diagnostics/prognostics systems. Any savings resulting from using diagnostics/prognostics were calculated.

24409 (CONF-9503168–1) **Defining the next generation munitions handler.** Cassiday, B.K. (San Antonio Air Logistics Center, Kelly AFB, TX (United States)); Koury, G.J.; Pin, F.G. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Agreement 2146-H055-A1. From 10. American Institute of Aeronautics and Astronautics (AIAA) conference on computing and aerospae; San Antonio, TX (United States); 28-30 Mar 1995. Order Number DE95013970. Source: OSTI; NTIS; GPO Dep.

RHIC 8 cm aperture dipole magnets and quadrupole cold masses are being built for Brookhaven National Laboratory (BNL) by Northrop-Grumman Corporation at a production rate of one dipole magnet and two quadrupole cold masses per day. This work was preceded by a lengthy Technology Transfer effort which is described elsewhere. This paper describes the tooling which is being used for the construction effort, the production operations at each workstation, and also the use of trend plots of critical construction parameters as a tool for monitoring performance in production. A

report on the improvements to production labor since the start of the programs is also provided. The magnet and cold mass designs, and magnetic test results are described in more detail in a separate paper.

24410 (SAND–94-2875) **Evaluation of commercially available exterior digital VMDs.** Ringler, C.E.; Hoover, C.E. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014129. Source: OSTI; NTIS; GPO Dep.

This report discusses the testing and evaluation of thirteen commercially available exterior digital video motion detection (VMD) systems. The systems were evaluated for use in a specific outdoor application. The report focuses primarily on the testing parameters, each system's advertised features, and the nuisance alarm and detection test results.

24411 (UCRL-JC–117608) **Molten salt destruction of energetic material wastes as an alternative to open burning.** Upadhye, R.S.; Brummond, W.A.; Pruneda, C.O.; Watkins, B.E. Lawrence Livermore National Lab., CA (United States). 8 Sep 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409352–1: United States/German data exchange agreement (DEA-1522) meeting, No City Given (Germany), 27-30 Sep 1994). Order Number DE95013452. Source: OSTI; NTIS; GPO Dep.

The Lawrence Livermore National Laboratory in conjunction with the Energetic Materials Center (a partnership of Lawrence Livermore and Sandia National Laboratories), is developing methods for the safe and environmentally sound destruction of explosives and propellants as a part of the Laboratory's ancillary demilitarization mission. As a result of the end of the Cold War and the shift in emphasis to a smaller stockpile, many munitions, both conventional and nuclear, are scheduled for retirement and rapid dismantlement and demilitarization. major components of these munitions are the explosives and propellants, or energetic materials. The Department of Energy has thousands of pounds of energetic materials which result from dismantlement operations at the Pantex Plant. The Department of Defense has several hundred million pounds of energetic materials in its demilitarization inventory, with millions more added each year.

24412 (WR-B–95-06) **Audit of construction of protective force training facilities at the Pantex Plant.** USDOE Office of Inspector General, Albuquerque, NM (United States). Western Regional Audit Office. 5 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI.

A goal of the Department of Energy project management system is to ensure that projects are necessary to fulfill mission needs and are cost effective. This requires that the Department justify each project and explore competitive alternatives. The objective of this audit was to assess the need to construct protective force training facilities at the Department's Pantex Plant. Our audit disclosed that (1) construction of a physical training facility was not necessary to fulfill mission needs, and (2) the Department did not consider all viable alternatives to constructing a weapons tactics and training facility. These conditions occurred, in part, because a Justification for New Start was never prepared and approved for the Security Enhancements Major System Acquisition, which included these two projects. We recommended that the Manager, Albuquerque Operations Office, cancel construction of the physical training facility, make needed repairs and upgrades to the existing facilities, and reduce the cost of the Security Enhancements Major System Acquisition accordingly. Implementation of this recommendation will save about $1.7 million. We also recommended that the Manager direct Mason & Hanger to perform economic analyses of all viable alternatives to constructing a weapons tactics and training facility before proceeding with construction. Such analyses could lead to cancellation or rescoping of the proposed facility and result in savings to the Department. Albuquerque management did not agree to cancel construction of the physical training facility, but did agree to perform economic analyses of all viable alternatives to the proposed weapons tactics and training facility before proceeding with construction.

4501 Chemical Explosions and Explosives

Refer also to citation(s) 24558, 25012

24413 (DOE/AL/65030–9421) **Treatment and recycle of high explosive contaminated water.** Locke, J.G. Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (United States). Sep 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL65030. Order Number DE95013542. Source: OSTI; NTIS; GPO Dep.

A polysulfone ultrafilter membrane having a 0.04-μm pore opening has been used to filter high explosive contaminated water. The water is being recycled for the coolant used during the machining of high explosive billets. High explosive contaminated wastewater is generated from the machining of high explosives at Pantex Plant. The water is used as the coolant during the machining operation. Typically, the water flow rate is from 2 to 3 gallons per minute. The water must be tempered to about room temperature so that it does not affect the dimensions of the explosive piece being machined. In normal operations, the wastewater and cuttings are allowed to flow to a centralized collection system. The solid explosives are separated from the water using a filtration and recycle system. The wastewater is collected in an air agitated receiving tank or sump. It is pumped from the sump to a settling cone where the solid particles are decanted off of the bottom. The overflow from the cone is collected in another tank and then pumped through two cyclone separators operated in series. This water is also collected in a holding tank prior to final filtration through a 25-μm filter. The effluent from the particle filter flows through two activated carbon filters operated in series prior to being discharged to a drainage ditch. This results in an average discharge of about 2,000 gallons per operating day from Building 11-50.

24414 (DOE/AL/65030–9505) **Size reduction of hemispherical explosive shells by waterjet.** Crutchmer, J.A.; Do, B.T.; Goodfellow, P.A. Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (United States). Feb 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL65030. Order Number DE95013543. Source: OSTI; NTIS; GPO Dep.

A water jet process has been developed to reduce hemispherical explosive shells to a form that can be recycled. A funnel shaped wet box was modified to hold the shells in place and contain all the explosive chips and slurry generated by the waterjet process. Size reduction was accomplished by cutting in spiral patterns starting at the center of the shell and moving outward. This method of size reduction produces less than one third the amount of waste water and requires less than one half the time to complete compared to conventional machining methods.

24415 (LA–13014-H) **The insensitive high explosive triaminotrinitrobenzene (TATB): Development and characterization, 1888 to 1994.** Dobratz, B.M. Los Alamos National Lab., NM (United States). Aug 1995. 131p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95016705. Source: OSTI; NTIS; GPO Dep.

Assembled in this report are data and references on TATB and its formulations from its first synthesis in 1888 to 1994. This compilation includes sections on synthesis and preparation, analytical methods, properties, performance, aging and compatibility, and on safety. The information is arranged in chronological order within each section. A bibliography rounds out the report.

24416 (SAND–95-0968C) **An overview of semiconductor bridge, SCB, applications at Sandia National Laboratories.** Bickes, R.W. Jr.; Grubelich, M.C.; Harris, S.M.; Merson, J.A.; Weinlein, J.H. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950720–5: AIAA/SAE/ASME joint propulsion conference and exhibit, San Diego, CA (United States), 10-12 Jul 1995). Order Number DE95011877. Source: OSTI; NTIS; GPO Dep.

The semiconductor bridge, SCB, developed by Sandia National Laboratories is a maturing technology now being used in several applications by Sandia customers. Most applications arose because of a need at the system level to provide explosive assemblies that were light weight, small volume, low cost and required

small quantities of electrical energy to function – for the purposes of this paper we define an explosive assembly to mean the combination of the firing set and an explosive component. As a result, and because conventional firing systems could not meet the stringent size, weight and energy requirements of our customers, we designed and are investigating SCB applications that range from devices for Sandia applications to igniters for fireworks. We present in this paper an overview of SCB technology with specific examples of the system designed for our customers to meet modern requirements that sophisticated explosive systems must satisfy in today's market environments.

24417 (SAND–95-8227) **Particle size reduction of propellants by cryocycling.** Whinnery, L. (and others); Griffiths, S.; Lipkin, J. Sandia National Labs., Livermore, CA (United States). May 1995. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015266. Source: OSTI; NTIS; GPO Dep.

Repeated exposure of a propellant to liquid nitrogen causes thermal stress gradients within the material resulting in cracking and particle size reduction. This process is termed cryocycling. The authors conducted a feasibility study, combining experiments on both inert and live propellants with three modeling approaches. These models provided optimized cycle times, predicted ultimate particle size, and allowed crack behavior to be explored. Process safety evaluations conducted separately indicated that cryocycling does not increase the sensitivity of the propellants examined. The results of this study suggest that cryocycling is a promising technology for the demilitarization of tactical rocket motors.

24418 (SAND–95-8235) **Cryocycling of energetic materials: Status report for FY94.** Lipkin, J. (ed.); Kasberg, D.; Whinnery, L.; Handrock, J.; Revelli, V.; Weingarten, L.; Griffiths, S.; Nilson, R. Sandia National Labs., Livermore, CA (United States). Jul 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015268. Source: OSTI; NTIS; GPO Dep.

The Cryocycling of Energetic Materials Project is sponsored by the Memorandum of Understanding (MOU) on advanced munition technologies. This MOU is an agreement between the Department of Energy and the Department of Defense (Office of Munitions) that facilitates the development of technologies of mutual interest to the two Departments. The cryocycling project is one of several that focus on demilitarization aspects of conventional weapons and weapon systems. During FY94 the project pursued the development of analytical and numerical models that can be used to describe and optimize the cryocycling process for preparing energetic materials for recycle and reuse. In addition, the demilitarization stockpile of the Department of Defense was analyzed to identify candidate munitions for the process, and pilot scale cryocycling operations were begun at an industrial contractor. When a material is cryocycled, it is repeatedly subjected to cycles of rapid cooling in a liquid nitrogen bath at 77 K followed by warming to ambient temperature. In laboratory and pilot scale demonstrations, the authors have shown that cryocycling can dramatically reduce the size of a variety of propellant grains and a number of cast and plastic bonded explosives.

24419 (SAND–95-8248) **Investigations of emergency destruction methods for recovered, explosively configured, chemical warfare munitions: Interim emergency destruction methods - evaluation report.** Baer, M.R. (and others); Cooper, P.W.; Kipp, M.E. Sandia National Labs., Albuquerque, NM (United States). Jul 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015840. Source: OSTI; NTIS; GPO Dep.

At the request of the U.S. Army Non-Stockpile Chemical Material Office, the Sandia Explosives Containment System Design Team investigated mature destruction systems for destroying recovered chemical warfare munitions (CWM). The goal of the investigations was to identify and examine available techniques for the destruction of recovered CWM. The result of this study is a recommendation for an interim solution, a solution for use on any munitions found while an optimal, long-term solution is developed. Sandia is also performing the long-term solution study to develop a system that destroys CWM, contains the blast and fragments, and destroys the chemical agent without insult to the environment.

24420 (UCRL-ID–119252) **The shock Hugoniot of glass microballoons.** Simpson, R.; Helm, F. Lawrence Livermore National Lab., CA (United States). Dec 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015846. Source: OSTI; NTIS; GPO Dep.

Shock Hugoniot measurements were made on glass microballoons. Input pressures ranging from 0.37-3.9 GPa produced compression from 860-690%. The Hugoniot curves were found to be anomalous in that the density shocked to decreases with increasing pressure.

24421 (UCRL-ID–119675) **A new insensitive explosive that has moderate performance and is low cost: 2,4-Dinitroimidazole.** Simpson, R. (and others); Coon, C.; Foltz, M. Lawrence Livermore National Lab., CA (United States). Jan 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015973. Source: OSTI; NTIS; GPO Dep.

Shock loading experiments were performed on 2,4-Dinitroimidazole. Results indicate that it is a very shock insensitive material. The performance of the material is expected to be 60% greater than TNT. Costs appear to be low but are unresolved at this time. 2,4-DNI may be a realistic alternative to TNT for mass-use bombs.

24422 (UCRL-JC–117608-Rev.1) **Molten salt destruction of energetic material wastes as an alternative to open burning. Revision 1.** Upadhye, R.S. (Lawrence Livermore National Lab., CA (United States). Energetic Materials Center); Brummond, W.A.; Pruneda, C.O.; Watkins, B.E. Lawrence Livermore National Lab., CA (United States). 2 Nov 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9411155–4-Rev.1: 1994 Luxembourg international symposium on the rehabilitation of military sites and demilitarization of explosive ordance, Kirchberg (Luxembourg), 14-18 Nov 1994). Order Number DE95013461. Source: OSTI; NTIS; GPO Dep.

As a result of the end of the Cold War and the shift in emphasis to a smaller stockpile, many munitions, both conventional and nuclear, are scheduled for retirement and rapid dismantlement and demilitarization. Major components of these munitions are the explosives and propellants, or energetic materials. The Molten Salt Destruction (MSD) Process has been demonstrated for the destruction of HE and HE-containing wastes. MSD converts the organic constituents of the waste into non-hazardous substances such as carbon dioxide, nitrogen and water. Any inorganic constituents of the waste, such as binders and metallic particles, are retained in the molten salt. LLNL has built a small-scale (about 1 kg/hr throughput) unit to test the destruction of HE using the MSD process. The authors have demonstrated that HE's and liquid propellants can be safely and fully destroyed using the molten salt destruction process. The authors are currently working on a number of improvements to the process. They are modifying the design of unit to obtain more throughput without any increase in salt entrainment. They are implementing an advanced nozzle design for injection of larger particles. They are defining operating envelopes for a number of high explosives and formulations. They are developing models to study the temperature profile of a top-feed nozzle for feeding larger particles into the unit.

24423 (UCRL-JC–117609) **Reusing main-charge explosives from the demilitarization of weapons.** Pruneda, C.O.; Mitchell, A.R. Lawrence Livermore National Lab., CA (United States). Aug 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409352–2: United States/German data exchange agreement (DEA-1522) meeting, No City Given (Germany), 27-30 Sep 1994). Order Number DE95013460. Source: OSTI; NTIS; GPO Dep.

We are formulating improved methods for reusing dismantled nuclear weapons. We are emphasizing the commercial value of these explosives and are working toward establishing processing protocols to ease the transition from dismantlement to commercial use. These applications on explosives removed from conventional ordnance or strategic materials from strategic/tactical rocket motors.

Discussed issues include: alternatives to burning, size reduction, reformulation, explosive powder recovery, chemical conversion, and legal matters.

24424 (UCRL-JC–117609-Rev.1) **Reusing main-charge explosives from the demilitarization of weapons. Revision 1.** Pruneda, C.O.; Mitchell, A.R. Lawrence Livermore National Lab., CA (United States). 1 Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9411155–5-Rev.1: 1994 Luxembourg international symposium on the rehabilitation of military sites and demilitarization of explosive ordance, Kirchberg (Luxembourg), 14-18 Nov 1994). Order Number DE95013453. Source: OSTI; NTIS; GPO Dep.

We are formulating improved methods for re-using dismantled nuclear weapons. We are emphasizing the commercial value of these explosives and are working toward establishing processing protocols to ease the transition from dismantlement to commercial use. These processes can have applications on explosives removed from conventional ordnance or energetic materials removed strategic/tactical rocket motors. Issues discussed in this report include: alternatives to burning, size reduction, reformulation, explosive powder recovery, chemical conversion, and legal issues.

24425 (UCRL-JC–119654) **Advances in the chemical conversion of energetic materials to higher value products.** Mitchell, A.R. (Lawrence Livermore National Lab., CA (United States). Energetic Materials Center); Pagoria, P.F.; Sanner, R.D. Lawrence Livermore National Lab., CA (United States). 24 Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941255–4: Life cycles of energetic materials, Del Mar, CA (United States), 11-16 Dec 1994). Order Number DE95013458. Source: OSTI; NTIS; GPO Dep.

The objective of this program is to develop novel, innovative solutions for the disposal of surplus explosives resulting from the demilitarization of nuclear and conventional munitions by DOE and DoD. Studies related to the conversion of TNT and Explosive D to potentially useful materials are described. The paper describes the feasibility of conversion of TNT to TATB; conversion of TNT to 3,5-diamino-2,4,6-trinitrotoluene (DATNT); conversion of TNT to tolylene 2,4-diisocyanate (TDI) and nitrotolylene and diisocyanate (NTDI); chelating resins derived from trinitroarenes.

24426 (DOE/EIS–0228D) **Dual Axis Radiographic Hydrodynamic Test Facility: Draft environmental impact statement.** USDOE Albuquerque Operations Office, NM (United States). May 1995. 468p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012204. Source: OSTI; NTIS; GPO Dep.

DOE proposes to provide enhanced high-resolution radiographic capability for hydrodynamic tests and dynamic experiments to meet its mission to conduct a science-based stockpile stewardship program for the Nation's nuclear weapons. The DARHT Facility would include two electron accelerators to produce x-ray beams that intersect at a firing point. This document evaluates the potential environmental impacts of six alternatives: No Action (continue to operate the 30-year-old Pulsed High Energy Radiation Machine Emitting X-Rays (PHERMEX) at Los Alamos National Laboratories (LANL) and the Flash X-Ray at Lawrence Livermore National Laboratory); Preferred Alternative (complete and operate the DARHT Facility at LANL); Upgrade PBERMEX (upgrade PHERMEX with enhanced radiography technology instead of completing the DARHT Facility); Enhanced Containment (in addition to containing all experiments involving plutonium, enclose most or all experiments inside a containment vessel or structure); Plutonium Exclusion (exclude any applications involving experiments with plutonium at the DARHT Facility); and Single-Axis (complete and operate only a single axis of the DARHT Facility). The affected environment is primarily within LANL. Analyses indicate very little difference in the environmental impacts among the alternatives. The major discriminator would be contamination of soils near the firing points, health effects to workers, and amount of construction materials.

24427 (DOE/IG–0375) **US Department of Energy Office of Inspector General report on audit of the Department of Energy's management of precious metals.** USDOE Office of Inspector General, Washington, DC (United States). Jun 1995. 20p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

The US Department of Energy (Department) used precious metals primarily in the production of nuclear weapons. In accordance with Strategic Arms Reduction Treaties, the Department stopped producing nuclear weapons and much of its precious metals inventory became excess to programmatic need. The purpose of the audit was to determine if the Department and contractor officials were efficiently and effectively administering this valuable asset. The authors found that 6 of 11 Departmental organizations were not adequately identifying and disposing of excess precious metals. At the time of the audit, the Department had approximately $52 million worth of precious metals inventory on hand. Included in this inventory was about $10.3 million that was considered excess. In addition, the Department has the opportunity to recover precious metals worth about $36 million from disassembled nuclear weapons that will also be excess to programmatic need. Although substantial quantities of excess precious metals existed, property management officials had not developed effective procedures to dispose of excess metals through other Government agencies or on the open market. The term precious metals is defined in the property management regulations as uncommon and highly valuable metals characterized by their superior resistance to corrosion and oxidation. Eight metals fall under this definition: gold, silver, platinum, palladium, rhodium, iridium, ruthenium, and osmium.

24428 (DOE/NV–383) **United States Department of Energy, Nevada Operations Office completion report: Fiscal year 1994.** USDOE Nevada Operations Office, Las Vegas, NV (United States). Jun 1995. 216p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014358. Source: OSTI; NTIS; GPO Dep.

The report provides a summary of activities conducted at the Nevada Test Site (NTS) between October 1, 1993, and September 30, 1994. In the past, each annual Completion Report dealt with a series of underground nuclear detonations; however, because no nuclear tests were conducted during fiscal year (FY) 1994, this report summarizes continuing nonnuclear and nuclear test readiness activities at the NTS. Sections describe the following: planning and review; test execution; operations coordination; safeguards and security; operations costs and manpower; external affairs; verification management; emergency response management; meteorological support; radiological safety; safety; environmental protection; geological and geophysical investigations; hydrologic investigations; seismic motion records repository; radioecologic investigations; cultural resources investigations; instrumentation and energy measurements services; architectural and engineering services; construction and support services; and Department of Defense activities.

24429 (KCP–613-5430) **Design specifications for manufacturability of MCM-C multichip modules.** Allen, C.; Blazek, R.; Desch, J.; Elarton, J.; Kautz, D.; Markley, D.; Morgenstern, H.; Stewart, R.; Warner, L. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Jun 1995. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE95014898. Source: OSTI; NTIS; GPO Dep.

The scope of this document is to establish design guidelines for electronic circuitry packaged as multichip modules of the ceramic substrate variety, although many of these guidelines are applicable to other types of multichip modules. The guidelines begin with prerequisite information which must be developed between customer and designer of the multichip module. The core of the guidelines focuses on the many considerations that must be addressed during the multichip module design. The guidelines conclude with the resulting deliverables from the design which satisfy customer requirements and/or support the multichip module fabrication and

testing processes. Considerable supporting information, checklists, and design constraints are captured in specific appendices and used as reference information in the main body text. Finally some real examples of multichip module design are presented.

24430 (KCP–613-5536) **CFC and CHC reduction at suppliers. Final report.** Carter, R.C. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Jul 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE95014897. Source: OSTI; NTIS; GPO Dep.

Alternative cleaning methods and materials were required to reduce the use of ozone-depleting solvents or potentially hazardous materials (chlorofluorocarbons and chlorinated hydrocarbons) at purchased product suppliers. Three groups of printed wiring boards were fabricated by Sparton Technology Inc., the vendor selected to complete the project. These printed wiring boards were evaluated in the Materials Engineering laboratory at the Kansas City Division. Recommendations included using a rosin-based flux and an enhanced cleaning process with Bioact EC-7R as the preferred solvent. Results of the study were included in the Solvent Waste Stream database.

24431 (SAND–94-2814C) **Computer modeling of electrical performance of detonators.** Furnberg, C.M. (Sandia National Labs., Livermore, CA (United States)); Peevy, G.R.; Brigham, W.P.; Lyons, G.R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950720–6: AIAA/SAE/ASME joint propulsion conference and exhibit, San Diego, CA (United States), 10-12 Jul 1995). Order Number DE95011878. Source: OSTI; NTIS; GPO Dep.

An empirical model of detonator electrical performance which describes the resistance of the exploding bridgewire (EBW) or exploding foil initiator (EFI or slapper) as a function of energy, deposition will be described. This model features many parameters that can be adjusted to obtain a close fit to experimental data. This has been demonstrated using recent experimental data taken with the cable discharge system located at Sandia National Laboratories. This paper will be a continuation of the paper entitled "Cable Discharge System for Fundamental Detonator Studies" presented at the 2nd NASA/DOD/DOE Pyrotechnic Workshop.

24432 (SAND–95-1364C) **Application of optimization to the inverse problem of finding the worst-case heating configuration in a fire.** Romero, V.J.; Eldred, M.S.; Bohnhoff, W.J.; Outka, D.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950715–1: 9. international conference on numerical methods in laminar and turbulent flow, Atlanta, GA (United States), 10-14 Jul 1995). Order Number DE95014861. Source: OSTI; NTIS; GPO Dep.

Thermal optimization procedures have been applied to determine the worst-case heating boundary conditions that a safety device can be credibly subjected to. There are many interesting aspects of this work in the areas of thermal transport, optimization, discrete modeling, and computing. The forward problem involves transient simulations with a nonlinear 3-D finite element model solving a coupled conduction/radiation problem. Coupling to the optimizer requires that boundary conditions in the thermal model be parameterized in terms of the optimization variables. The optimization is carried out over a diverse multi-dimensional parameter space where the forward evaluations are computationally expensive and of unknown duration a priori. The optimization problem is complicated by numerical artifacts resulting from discrete approximation and finite computer precision, as well as theoretical difficulties associated with navigating to a global minimum on a nonconvex objective function having a fold and several local minima. In this paper we report on the solution of the optimization problem, discuss implications of some of the features of this problem on selection of a suitable and efficient optimization algorithm, and share lessons learned, fixes implemented, and research issues identified along the way.

4503 Nuclear Explosion Detection

24433 (UCRL-ID–121036) **Pre-shot predictions and instrumentation of the KUCHEN experiment.** Moran, B.; Heinle, R.A.; Harben, P.E. Lawrence Livermore National Lab., CA (United States). May 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014514. Source: OSTI; NTIS; GPO Dep.

We calculated the peak particle velocity and peak acceleration at gage locations for the three explosions of the KUCHEN experiment. Our predictions of the peak particle velocities and accelerations are consistent with a variety of other estimates which include surface motion obtained from underground nuclear explosions in alluvium, a tamped HE explosion at the Nevada Test Site, and the ConWep estimates which are used for conventional weapons effects calculations. We also predict the air blast overpressure and the temperature rise in the air inside the cavity of the decoupled explosion and find that the peak pressure at the top of the cylindrical cavity is about 50 bars and that the shock-wave reverberations inside the cavity have a period of about 100 ms. After 500 ms, the shock wave reverberations inside the cavity of the decoupled explosion are considerably attenuated and the equilibrium state before any significant diffusion or thermal conduction occurs is a pressure of 5 bars and a temperature of 1100°C. The instrumentation of the experiment is designed for containment diagnostics, near-field in-situ motion, and ground motion monitoring. The containment diagnostics include an air-blast overpressure gage, an RF Interferometer, a strain gage, two thermocouples and two cavity pressure gages. Additional gages detect the presence of hazardous detonation products. Near field motion diagnostics include four three-axis accelerometers at various depths and a single three-axis velocity gage. The seismic ground motion sensors are located in 24 distinct locations and distributed in a modified symmetrical pattern around the borehole. Using a simple constitutive model which correctly predicts peak particle velocity data in porous alluvium, we calculated a decoupling factor that varies from 4 to 11 in the frequency range between 1 and 30 hertz. Using that same model, we calculated a decoupling factor of 15 in a spherical cavity with equivalent volume.

24434 (UCRL-ID–121228) **Preliminary report on the implications of mining practices in an open-pit gold mine for monitoring of a comprehensive Test Ban Treaty.** Jarpe, S.P.; Goldstein, P.; Moran, B.; Glenn, L.A. Lawrence Livermore National Lab., CA (United States). Jul 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015985. Source: OSTI; NTIS; GPO Dep.

This report summarizes the preliminary results of an ongoing experiment at the Gold Quarry pit, operated by the Newmont Gold Company at Carlin, NV. The purpose of the experiment is to obtain local and regional seismic data together with "ground truth", from conventional surface blasting activity and to use these data to help determine the effectiveness with which conventional mining blasts can be discriminated from underground nuclear explosions.

4505 Strategic Defense Initiative

24435 (SAND–95-0798) **Measures of effectiveness for BMD mid-course tracking on MIMD massively parallel computers.** VanDyke, J.P.; Tomkins, J.L.; Furnish, M.D. Sandia National Labs., Albuquerque, NM (United States). May 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013035. Source: OSTI; NTIS; GPO Dep.

The TRC code, a mid-course tracking code for ballistic missiles, has previously been implemented on a 1024-processor MIMD (Multiple Instruction – Multiple Data) massively parallel computer. Measures of Effectiveness (MOE) for this algorithm have been developed for this computing environment. The MOE code is run in parallel with the TRC code. Particularly useful MOEs include the number of missed objects (real objects for which the TRC algorithm did not construct a track); of ghost tracks (tracks not corresponding to a real object); of redundant tracks (multiple tracks corresponding

to a single real object); and of unresolved objects (multiple objects corresponding to a single track). All of these are expressed as a function of time, and tend to maximize during the time in which real objects are spawned (multiple reentry vehicles per post-boost vehicle). As well, it is possible to measure the track-truth separation as a function of time. A set of calculations is presented illustrating these MOEs as a function of time for a case with 99 post-boost vehicles, each of which spawns 9 reentry vehicles.

24436 (UCRL-JC–120857) **The Clementine longwave infrared camera.** Priest, R.E. (Lawrence Livermore National Lab., CA (United States)); Lewis, I.T.; Sewall, N.R.; Park, H.S.; Shannon, M.J.; Ledebuhr, A.G.; Pleasance, L.D.; Massie, M.A.; Metschuleit, K. Lawrence Livermore National Lab., CA (United States). Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950472–15: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95014387. Source: OSTI; NTIS; GPO Dep.

The Clementine mission provided the first ever complete, systematic surface mapping of the moon from the ultra-violet to the near-infrared regions. More than 1.7 million images of the moon, earth and space were returned from this mission. The longwave-infrared (LWIR) camera supplemented the UV/Visible and near-infrared mapping cameras providing limited strip coverage of the moon, giving insight to the thermal properties of the soils. This camera provided ~100 m spatial resolution at 400 km periselene, and a 7 km across-track swath. This 2.1 kg camera using a 128 x 128 Mercury-Cadmium-Telluride (MCT) FPA viewed thermal emission of the lunar surface and lunar horizon in the 8.0 to 9.5 μm wavelength region. A description of this light-weight, low power LWIR camera along with a summary of lessons learned is presented. Design goals and preliminary on-orbit performance estimates are addressed in terms of meeting the mission's primary objective for flight qualifying the sensors for future Department of Defense flights.

24437 (UCRL-JC–120858) **Near-infrared camera for the Clementine mission.** Priest, R.E. (Lawrence Livermore National Lab., CA (United States)); Lewis, I.T.; Sewall, N.R.; Park, H.S.; Shannon, M.J.; Ledebuhr, A.G.; Pleasance, L.D.; Massie, M.A.; Metschuleit, K. Lawrence Livermore National Lab., CA (United States). Apr 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950472–11: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95014385. Source: OSTI; NTIS; GPO Dep.

The Clementine mission provided the first ever complete, systematic surface mapping of the moon from the ultra-violet to the near-infrared regions. More than 1.7 million images of the moon, earth and space were returned from this mission. The near-infrared (NIR) multi-spectral camera, one of two workhorse lunar mapping cameras (the other being the UV/visible camera), provided ~200 in spatial resolution at 400 km periselene, and a 39 km across-track swath. This 1.9 kg infrared camera using a 256 x 256 InSb FPA viewed reflected solar illumination from the lunar surface and lunar horizon in the 1 to 3 μm wavelength region, extending lunar imagery and mineralogy studies into the near infrared. A description of this light-weight, low power NIR camera along with a summary of lessons learned is presented. Design goals and preliminary on-orbit performance estimates are addressed in terms of meeting the mission's primary objective for flight qualifying the sensors for future Department of Defense flights.

24438 (UCRL-JC–120866) **UV/visible camera for the Clementine mission.** Kordas, J.F. (and others); Lewis, I.T.; Priest, R.E. Lawrence Livermore National Lab., CA (United States). Apr 1995. 14p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950472–10: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95014386. Source: OSTI; NTIS; GPO Dep.

This article describes the Clementine UV/Visible (UV/Vis) multispectral camera, discusses design goals and preliminary estimates of on-orbit performance, and summarizes lessons learned in building and using the sensor. While the primary objective of the Clementine Program was to qualify a suite of 6 light-weight, low power imagers for future Department of Defense flights, the mission also has provided the first systematic mapping of the complete lunar surface in the visible and near-infrared spectral regions. The 410 g, 4.65 W UV/Vis camera uses a 384 x 288 frame-transfer silicon CCD FPA and operates at 6 user-selectable wavelength bands between 0.4 and 1.1 μm. It has yielded lunar imagery and mineralogy data with up to 120 in spatial resolution (band dependent) at 400 km periselene along a 39 km cross-track swath.

24439 (UCRL-JC–120867) **Star tracker stellar compass for the Clementine mission.** Kordas, J.F. (and others); Lewis, I.T.; Wilson, B.A. Lawrence Livermore National Lab., CA (United States). Apr 1995. 14p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950472–9: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95014384. Source: OSTI; NTIS; GPO Dep.

The Clementine mission provided the first ever complete, systematic surface mapping of the moon from the ultra-violet to the near-infrared regions. More than 1.7 million images of the moon, earth and space were returned from this mission. Two star tracker stellar compasses (star tracker camera + stellar compass software) were included on the spacecraft, serving a primary function of providing angle updates to the guidance and navigation system. These cameras served a secondary function by providing a wide field of view imaging capability for lunar horizon glow and other dark-side imaging data. This 290 g camera using a 576 x 384 FPA and a 17 mm entrance pupil, detected and centroided stars as dim and dimmer than 4.5 m_V, providing rms pointing accuracy of better than 100 μrad pitch and yaw and 450 μrad roll. A description of this light-weight, low power star tracker camera along with a summary of lessons learned is presented. Design goals and preliminary on-orbit performance estimates are addressed in terms of meeting the mission's primary objective for flight qualifying the sensors for future Department of Defense flights.

24440 (UCRL-JC–120870) **HiRes camera and LIDAR ranging system for the Clementine mission.** Ledebuhr, A.G. (and others); Kordas, J.F.; Lewis, I.T. Lawrence Livermore National Lab., CA (United States). Apr 1995. 20p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950472–14: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95014396. Source: OSTI; NTIS; GPO Dep.

Lawrence Livermore National Laboratory developed a space-qualified High Resolution (HiRes) imaging LIDAR (Light Detection And Ranging) system for use on the DoD Clementine mission. The Clementine mission provided more than 1.7 million images of the moon, earth, and stars, including the first ever complete systematic surface mapping of the moon from the ultra-violet to near-infrared spectral regions. This article describes the Clementine HiRes/LIDAR system, discusses design goals and preliminary estimates of on-orbit performance, and summarizes lessons learned in building and using the sensor. The LIDAR receiver system consists of a High Resolution (HiRes) imaging channel which incorporates an intensified multi-spectral visible camera combined with a Laser ranging channel which uses an avalanche photo-diode for laser pulse detection and timing. The receiver was bore sighted to a light-weight McDonnell-Douglas diode-pumped ND:YAG laser transmitter that emmitted 1.06 μm wavelength pulses of 200 mJ/pulse and 10 ns pulse-width, The LIDAR receiver uses a common F/9.5 Cassegrain telescope assembly. The optical path of the telescope is split using a color-separating beamsplitter. The imaging channel incorporates a filter wheel assembly which spectrally selects the light which is imaged onto a custom 12 mm gated image intensifier fiber-optically-coupled into a 384 x 276 pixel frame transfer CCD FPA. The image intensifier was spectrally sensitive over the 0.4 to 0.8 μm wavelength region. The six-position filter wheel contained 4 narrow spectral filters, one broadband and one blocking filter. At

periselene (400 km) the HiRes/LIDAR imaged a 2.8 km swath width at 20-meter resolution. The LIDAR function detected differential signal return with a 40-meter range accuracy, with a maximum range capability of 640 km, limited by the bit counter in the range return counting clock.

(CONF-9505224–1: International Emergency Management and Engineering Society, Nice (France), 9-12 May 1995). Order Number DE95013420. Source: OSTI; NTIS; GPO Dep.

As part of the Chemical Stockpile Emergency Preparedness Program, an Accident Planning Base Review Group (APBRG) was convened in December 1992. The APBRG's mission was to update the accident basis for protective action strategy planning in the vicinity of eight US chemical agent stockpile sites. The results of the APBRG's work are being issued as site-specific Emergency Planning Guides (EPGs). The EPGs give emergency planners–Army, State, and local–updated assessment of the chemical hazard and guidance on how to plan for a broad range of accidents by planning for a manageable number of accident categories. This paper addresses: (1) the rationale for updating the accident planning base; (2) the modeling methodology used to assess the chemical hazard; and (3) strategies that are advocated in the EPGs for the use of models by planners.

This paper reviews the key parameters comprising airborne radiological and chemical release source terms, discusses the ranges over which values of these parameters occur for plausible but severe waste management facility accidents, and relates the concomitant sensitivities of emergency planning zone boundaries predicted on calculated distances to early severe health effects.

24445 (ANL/ER/CP–84198) **An investigation of vertical winds obtained from vertically pointing and tilted beams of a five-beam 915-MHz wind profiler.** Coulter, R.L.; Martin, T.J. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9503104–5: 9. symposium on meteorological observations and instrumentation, Charlotte, NC (United States), 27-31 Mar 1995). Order Number DE95012265. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) Atmospheric Radiation Measurement (ARM) Program has operated a 915-MHz radar wind profiler coupled with a Radio Acoustic Sounding System (RASS) since November 1992 at its Southern Great Plains (SGP) Cloud and Radiation Testbed (CART) central facility in north central Oklahoma. The system is designed to provide continuous wind profiles from near the surface (100 m) to 5 km or more and virtual temperature profiles from near the surface to 1.5 km. During normal operation (see Table 1), the system uses four tilted beams (two each in the north-south and east-west vertical planes) and a single vertical beam to determine mean wind and virtual temperature profiles every hour. In this paper we illustrate and compare different methods for calculating w and several statistical variables from profiler data. The results are compared with those derived when the profiler is operated in a vertical-only mode under similar conditions.

24446 (ANL/ER/CP–85219) **A three-month comparison of hourly winds and temperatures from co-located 50-MHz and 915-MHz RASS profilers.** Coulter, R.L.; Holdridge, D.J. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9503104–4: 9. symposium on meteorological observations and instrumentation, Charlotte, NC (United States), 27-31 Mar 1995). Order Number DE95012266. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) Atmospheric Radiation Measurement (ARM) Program has operated a 915-MHz and a 50-MHz radar wind profiler (boundary layer profiler (BLP) and tropospheric profiler (TP), respectively], each coupled with a Radio Acoustic Sounding System (RASS) since April 1994 at its Southern Great Plains (SGP) Cloud and Radiation Testbed (CART) central facility in north central Oklahoma. The dual system is designed to provide continuous wind profiles from near the surface to 12 km or more and virtual temperature profiles from near the surface to 6 km. Because the BLP has a larger antenna than many other 915-MHz systems, the wind profiles sampled by the two systems overlap between 1.5 km and 5.5 km. The two systems are adjacent, so the wind profilers sample almost identical air masses in their overlap region during the averaging period. Nevertheless, the two RASS systems can be compared, and methods can be devised to estimate the temperature profile in the inaccessible region. Data used in all comparisons and calculations discussed below are

consensus-averaged values supplied by the profiler software. Although the spectra and moments from the data are available, they were not accessed for this analysis.

24447 (ANL/ER/CP–86001) **Comparison of satellite-derived and observer-based determinations of cloud cover amount at the SGP CART site.** Liaw, Y.P. (North Central College, Naperville, IL (United States). Dept. of Physics); Cook, D.R.; Sisterson, D.L.; Gao, W. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9503140–4: 5. atmospheric radiation measurement (ARM) meeting, San Diego, CA (United States), 20-23 Mar 1995). Order Number DE95012401. Source: OSTI; NTIS; GPO Dep.

Cloud-climate feedback is one of the most important factors in predicting the timing and magnitude of global climate change and its regional effects. Recent satellite measurements indicate that global effects of clouds on solar and infrared radiation are large. The experimental objective of the Atmospheric Radiation Measurement (ARM) Program is to characterize, empically, the radiative processes in the Earth's atmosphere with improved resolution and accuracy. Therefore, the effective treatment of cloud formation and cloud properties is crucial for reliable climate prediction. This study focuses on the analysis of cloud cover data for the ARM Southern Great Plains (SGP) Cloud and Radiation Testbed (CART) site central facility. The data set was obtained from the Advanced Very High Resolution Radiometer (AVHRR) on National Oceanic and Atmospheric Administration (NOAA) Satellites 11 and 12, and cloud observations made by SGP CART site operators. Such an analysis provides a basis for future evaluations with whole-sky cameras and provides a means of assessing the reliability of surface-based observations of cloud cover at the SGP CART site.

24448 (ANL/ER/CP–86626) **Performance of radar wind profilers, radiosondes, and surface flux stations at the SGP CART site.** Coulter, R.L. (Argonne National Lab., IL (United States). Environmental Research Div.); Lesht, B.M.; Wesely, M.L.; Cook, D.R.; Holdridge, D.J.; Martin, T.J. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9503140–8: 5. atmospheric radiation measurement (ARM) meeting, San Diego, CA (United States), 20-23 Mar 1995). Order Number DE95013464. Source: OSTI; NTIS; GPO Dep.

The performance of several routinely operating observational systems at the Southern Great Plains (SGP) Cloud and Radiation Testbed (CART) site has been evaluated. The results of a few specific investigations are shown here for Radar Wind Profilers (RWPs) and Radio Acoustic Sounding Systems (RASSs), Balloon-Borne Sounding Systems (BBSSs), and Energy Balance Bowen Ratio (EBBR) stations.

24449 (ANL/ES/CP–83898) **Estimation of monetary values of air pollutant emissions in various US areas.** Wang, M.Q.; Santini, D.J. Argonne National Lab., IL (United States). 17 Aug 1994. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950193–1: 74. annual transportation research board meeting, Washington, DC (United States), 11-15 Jan 1995). Order Number DE95013388. Source: OSTI; NTIS; GPO Dep.

Two general methods of estimating monetary values of air pollutants are presented in this paper. The damage estimate method directly estimated, air pollutant by simulating air quality, identifying health and other welfare impacts damage values and valuing the identified impacts of air pollution, and valuing the identified impacts. Although the method is theoretically sound, many assumptions are involved in each of its estimation steps, and uncertainty exists in each step. The control cost estimate method estimates the marginal emission control cost, which represents the opportunity cost offset by emission reductions from some given control measures. Studies conducted to estimate emission values in US regions used either the damage estimate method or the control cost estimate method. Taking emission values estimated for some US air basins, this paper establishes regression relationships between emission values and total population and air pollutant concentrations. On the basis of the established relationships, both damage-based and control-cost-based emission values are estimated for 17 major US urban areas.

24450 (ANL/ET/CP–85044) **Development of a millimeter-wave sensor for environmental monitoring.** Gopalsami, N.; Bakhtiari, S.; Raptis, A.C. Argonne National Lab., IL (United States). Jun 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950793–1: 40. annual meeting of the Society of Photo-Optical Instrumentation Engineers: international symposium on optical science, engineering and instrumentation, San Diego, CA (United States), 9-14 Jul 1995). Order Number DE95014228. Source: OSTI; NTIS; GPO Dep.

A millimeter-wave (mm-wave) sensor in the frequency range of 225-315 GHz is being developed for continuous emission monitoring of airborne effluents from industrial sites for environmental compliance monitoring and process control. Detection of chemical species is based on measuring the molecular rotational energy transitions at mm-wave frequencies. The mm-wave technique offers better transmission properties compared to optics in harsh industrial environments with smoke, dust, aerosols, and steam, as well as in adverse atmospheric conditions. The laboratory measurements indicate that polar molecules can be measured with a sensitivity of tens of parts-per-million-meter using this technology. Proof of principle of the open-path system was tested by releasing and detecting innocuous chemicals in the open air. It uses a monostatic radar configuration with transmitter and receiver on one side and a corner cube on tire other side of the plume to be measured. A wide-band swept frequency mm-wave signal is transmitted through the plume and return signal from the corner cube is detected by a hot-electron-bolometer. Absorption spectra of plume gases are measured by comparing the return signals with and without the plume in the beam path. Using signal processing based on deconvolution, high specificity of detection has been shown for resolving individual chemicals from a mixture. This technology is applicable for real-time measurement of a suite of airborne gases/vapors emitted from vents and stacks of process industries. A prototype sensor is being developed for wide-area monitoring of industrial sites and in-place monitoring of stack gases.

24451 (BNL–61619) **Modelling absorption and dilution of unconfined releases of hazardous gases by water curtains or monitors.** Fthenakis, V.M. (Brookhaven National Lab., Upton, NY (United States)); Blewitt, D.N.; Hague, W.J. Brookhaven National Lab., Upton, NY (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950927–2: International conference and workshop on modeling and mitigating the consequences of accidental releases of hazardous materials, New Orleans, LA (United States), 26-29 Sep 1995). Order Number DE95011350. Source: OSTI; NTIS; GPO Dep.

OSHA Process Safety Management guidelines suggest that a facility operator investigate and document a plan for installing systems to detect, contain, or mitigate accidental releases if such systems are not already in place. In addition, proposed EPA 112(r) regulations would require such analysis. This paper illustrates how mathematical modelling can aid such an evaluation and describes some recent enhancements of the HGSPRAY model: (1) Adding algorithms for modeling NH_3 and LNG mitigation; (2) Modeling spraying of releases with fire water monitors encircling the point of release; (3) Combining wind tunnel modeling with mathematical modeling; and (4) Linking HGSPRAY and BEGADAS. Case cases are presented as examples of how HGSPRAY can aid the design of water spray systems for initiation of toxic gases (e.g., BF, NH_3) or dilution/dispersion of flammable vapors (e.g., LNG).

24452 (CONF-930133–12) **Impact of cloud microphysics on the CSU GCM atmospheric moisture budget.** Fowler, L.D.; Randall, D.A. Colorado State Univ., Fort Collins, CO (United States). Dept. of Atmospheric Science. [1993]. 6p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract FG02-91ER61218. G atm-8907414. From 73. American Meteorological Society (AMS) annual meeting; Anaheim, CA (United States); 17-22 Jan 1993. Order Number DE95008978. Source: OSTI; NTIS; GPO Dep.

In this article, we present the first maps of the global distribution of the cloud liquid and ice water contents of the atmosphere. It is shown that the cloud microphysics package produces realistic distributions of both moisture variables. We axe presently adapting the present model so that long-term simulations with the CSU GCM may be made. In the near future, we plan to couple the cloud liquid and ice water contents prognosed by the cloud microphysics package with the cloud fraction and cloud optical properties.

24453 (CONF-940277–, pp. 1-3) **Single-column models as a bridge between observations and climate models.** Randall, D.A. (Colorado State Univ., Fort Collins, CO (United States)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Among the several approaches to testing General Circulation Model (GCM) parameterizations by comparison with observations, single-column models (SCMs) have some unique advantages. Cloud ensemble models (CEMs) are a useful supplement to SCMs. They can be used in much the same way and have essentially the same data requirements. The data required to drive the SCMs and CEMs, and to evaluate their performance, are not easy to obtain. ARM, and especially the ARM SGP site, and especially the ARM SGP site during IOPs, has the potential to provide uniquely valuable data for SCM-based parameterization testing. Use of ARM data in SCMs and CEMs will be particularly valuable for testing cloud amount parameterizations.

24454 (CONF-940277–, pp. 5-9) **Quality measurement experiments within the Atmospheric Radiation Measurement Program.** Miller, N.E. (Pacific Northwest Lab., Richland, WA (United States)); Liljegren, J.C.; Shippert, T.R.; Clough, S.A.; Brown, P.D. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. DOE Contract AC06-76RL01830. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The general goal of the Atmospheric Radiation Measurement (ARM) Program is to improve general circulation and related models of the atmosphere for global and regional prediction (DOE 1990). To achieve this goal, ARM is collecting a prodigious volume of data at its first Cloud and Radiation Testbed (CART) facility in the Southern Great Plains. Because data must be of "known and reasonable" quality, quality measurement experiments (QMEs) are a critical part of the ARM quality assessment program. In this paper, we describe the general theory behind the QMEs, explain how they are implemented in the CART data environment, and give a brief synopsis of those implemented to date.

24455 (CONF-940277–, pp. 11-14) **Scale-invariance, non-stationarity and intermittency in the structure of cloudiness.** Wiscombe, W. (Goddard Space Flight Center, Greenbelt, MD (United States)); Davis, A.; Marshak, A.; Cahalan, R. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

One of the main goals of the Atmospheric Radiation Measurement (ARM) Program is to better understand cloud-radiation interaction in order to improve our climate forecasting skills. We use data on the distribution of atmospheric liquid water from a variety of sources, including ARM's routine ground-based retrievals, and a number of carefully selected statistical properties to obtain simple and robust yet dynamically relevant characterizations of cloudiness. These characterizations are a prerequisite for developing more realistic stochastic cloud models which can be used to investigate numerically rediative transfer issues, leading, in particular, to better GCM radiation schemes.

24456 (CONF-940277–, pp. 15-17) **Preliminary analysis of ground-based microwave and infrared radiance observations during the pilot radiation OBservation experiment.** Westwater, E.R. (Environmental Technology Lab., Boulder, CO (United States)); Han, Y.; Churnside, J.H.; Snider, J.B. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

During Phase Two of the Pilot Radiation OBservation Experiment (PROBE) held in Kavieng, Papuo New Guinea, the National Oceanic and Atmospheric Administration's Environmental Technology Laboratory (ETL) operated both microwave and infrared radiometers. Phase Two lasted from January 6 to February 28, 1993. The dramatic differences in the water vapor environment between the tropics and mid-latitudes were illustrated by Westwater et al. (1994) who presented PROBE data as well as additional data that were taken during the 1991 First ISCCP Regional Experiment (FIRE) II experiment in Coffeyville, Kansas. Here, we present an analysis of microwave data and preliminary analysis of infrared data obtained during PROBE.

24457 (CONF-940277–, pp. 19-25) **North Slope of Alaska and adjacent Arctic Ocean cloud and radiation testbed: Science and siting strategies.** Zak, B.D. (Sandia National Labs., Albuquerque, NM (United States)); Stamnes, K. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

This paper serves as a summary of the current thinking regarding the development of the Atmospheric Radiation Measurement (ARM) Program's North Slope of Alaska and adjacent Arctic Ocean (NSA/AAO) Cloud and Radiation Testbed (CART) site. The broad rationale for a high latitude (HL) CART site can be summarized as follows: Fundamentally different atmospheric and surface physics are important at high latitudes; High latitudes strongly influence global climate in a number of ways; Interpretation of satellite remote sensing data to obtain the distribution and character of high latitude clouds, snow and sea ice is an important, but poorly solved problem.

24458 (CONF-940277–, pp. 27-30) **Surface Heat Budget of the Arctic Ocean (SHEBA).** Curry, J.A. (Univ. of Colorado, Boulder, CO (United States)); Moritz, R.; Untersteiner, N.; Randall, D.A.; McPhee, M. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The interaction of the ocean and the atmosphere is a key to understanding and ultimately predicting global climate. Our present understanding is that Arctic air-sea-ice processes influence global climate by modifying the surface albedo and the global thermohaline circulation. Although the sensitivity of global climate to processes occuring in the Arctic Ocean is widely acknowledged, there is great uncertainty about the magnitude and overall effect. To improve our knowledge of Arctic and global climate requires multivariate data sets of two kinds: An accurate climatology, including monthly mean values and variances for the major quantities that characterize the Arctic air-sea-ice system; and, Detailed process-oriented data sets that document the simultaneous temporal variations of the coupled atmosphere-sea ice-ocean system on time scales of hours to a year. To address these issues, a program, Surface Heat Budget of the Arctic Ocean (SHEBA) that will combine in situ observations, satellite remote sensing, analysis and modeling has been proposed. To achieve the overall scientific goals of SHEBA, the following specific issues will be addressed:

Surface heat and mass budget; Arctic clouds; Upper ocean interactions; and, Coupled sensitivity of ice, atmosphere and ocean. To meet the goals and scientific objectives of SHEBA will require the following components: a one-year filed program over the Arctic Ocean pack ice, a satellite remote sensing component, and a modeling component.

24459 (CONF-940277–, pp. 31-38) **Overview of North Slope of Alaska/adjacent Arctic Ocean Science issues.** Ellingson, R.G. (Univ. of Maryland, College Park, MD (United States)); Curry, J.A.; Stamnes, K.; Walsh, J.E.; Zak, B.D. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The following material is based on presentations made during the ARM Science Team Meeting concerning the scientific issues to be addressed at the North Slope of Alaska/Adjacent Arctic Ocean (NSA/AAO) Atmospheric Radiation Measurement (ARM) Site and how these and complementary issues are being addressed in other national and international programs. The scientific objectives for the NSA/AAO site, which are to be achieved in cooperation with Surface Heat Budget of the Arctic Ocean (SHEBA) and the First ISCCP Regional Experiment (FIRE)III, include the following: The radiative effects of mixed phase and ice phase clouds, aerosols, and cloud-aerosol mixtures; Description of basic cloud microphysical properties and the influence of atmospheric thermodynamics; The relative importance of surface and advective fluxes of moisture in the formation of clouds; The sensitivity of the boundary layer clouds to large-scale vertical motion; Interactions among turbulence, radiation, and cloud microphysical processes; The radiative effects of the horizontally inhomogeneous summertime stratocumulus clouds over the horizontally inhomogeneous, melting snow/sea ice surface; Response of surface albedo and ablation as a response to energy inputs.

24460 (CONF-940277–, pp. 39-40) **Atmospheric Radiation Measurement Program - unmanned aerospace vehicle: The follow-on phase.** Vitko, J. Jr. (Sandia National Labs., Livermore, CA (United States)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Unmanned Aerospace Vehicle (UAV) demonstration flights (UDF) are designed to provide an early demonstration of the scientific utility of UAVs by using an existing UAV and instruments to measure broadband radiative flux profiles under clear sky conditions. UDF is but the first of three phases of ARM-UAV. The second phase significantly extends both the UAV measurement techniques and the available instrumentation to allow both multi-UAV measurements in cloudy skies and extended duration measurements in the tropopause. These activities build naturally to the third and final phase, that of full operational capability, i.e., UAVs capable of autonomous operations at 20-km altitudes for multiple days with a full suite of instrumentation for measuring radiative flux, cloud properties, and water vapor profiles.

24461 (CONF-940277–, pp. 41-44) **Summary of single-column model intensive observation period workshop at annual atmospheric radiation measurement science team meeting.** Randall, D.A. (Colorado State Univ., Fort Collins, CO (United States)); Cederwall, R.T. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The objectives of this working group are to: Review recently completed winter single-column model (SCM) intensive observation period (IOP), including data collected and delivery schedule to Atmospheric Radiation Measurement (ARM) Science Team; Evaluate adequacy of measurements (value-added data) available from recent and future SCM IOPs; Recommend changes and additions to ARM observation strategies, external data acquisition, and data algorithms to enhance SCM efforts in ARM; Increase the interaction among SCM investigators and facilitate interaction with and guidance of the ARM infrastructure support of SCM activities within ARM.

24462 (CONF-940277–, pp. 45-46) **Unmanned Aerospace Vehicle Workshop.** Vitko, J. Jr. (Sandia National Labs., Livermore, CA (United States)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The Unmanned Aerospace Vehicle (UAV) Workshop concentrated on reviewing and refining the science experiments planned for the UAV Demonstration Flights (UDF) scheduled at the Oklahoma Cloud and Radiation Testbed (CART) in April 1994. These experiments were focused around the following sets of parameters: Clear sky, daylight; Clear-sky, night-to-day transition; Clear sky - improve/validate the accuracy of radiative fluxes derived from satellite-based measurements; Daylight, clouds of opportunity; and, Daylight, broken clouds.

24463 (CONF-940277–, pp. 47-53) **Calibration of radiation codes used in climate models: Comparison of clear-sky calculations with observations from the spectral radiation experiment and atmospheric radiation measurement program.** Ellingson, R.G. (Univ. of Maryland, College Park, MD (United States)); Shen, S.; Warner, J. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The InterComparison of Radiation Codes in Climate Models (CRCCM) showed large differences between model calculations of longwave fluxes and heating rates - even for clear sky conditions. Discrepancies could not be resolved and eventually the Atmospheric Radiation Measurement (ARM) Program arose to conduct spectral radiation experiments to resolve the discrepancies. The long term objectives of the study are to: Determine the range of agreement between longwave observations and model calculations ranging from line-by-line models to those used in climate models; Understand the causes for the differences between calculations and observations; and, Determine improved parameterizations for use in climate models. This paper summarizes preliminary results obtained from the comparisons of calculations made by different models with observations obtained during the SPECTRE and ARM. The study is limited at this time to clear-sky conditions because we believe it is necessary to ascertain the performance of radiation models under these conditions in order to more fully understand observations made under more general cloudy conditions.

24464 (CONF-940277–, pp. 65-69) **Explicit simulation of a tropical mesoscale convective system.** Alexander, G.D. (Colorado State Univ., Fort Collins, CO (United States)); Cotton, W.R. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. DOE Contract FG02-90ER61066 ; FG03-94ER61749. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

We have used Colorado State University's Regional Atmospheric Modeling System (RAMS) to simulate the MCS observed during the ninth flight mission of the Equatorial Mesoscale Experiment (EMEX9). Research aircraft probed EMEX9 on 2-3 February 1987. RAMS successfully captures the observed characteristics of EMEX9, including temporal initiation, geographic location, speed

and direction of motion of the system, spatial arrangement of the convective cells and stratiform region, and updraft and downdraft speeds. We have used several different kinds of analysis techniques in order to distill the copious amounts of data provided by the simulation into some coherent view of EMEX9. Conditional sampling of model output uncovers a strange convergence maximum at about 10 km in the intermediary region - perhaps a physical footprint of the production of EMEX9's vast stratiform anvil. Applying the RAMS LPDM enables us to identify the major simulated flow branches, including a conspicuous front-to-rear ascending flow branch. Analysis of vertical forcing terms along this flowbranch shows that a brief burst of upward directed vertical pressure gradient force initiates the ascent before upward buoyancy dominates, consistent with the idea that some trigger is needed to force ascent into a conditionally unstable atmosphere.

24465 (CONF-940277–, pp. 71-73) **A comparison of model-simulated relative humidity with satellite-derived cloudiness.** Alliss, R.J. (North Carolina State Univ., Raleigh, NC (United States)); Raman, S. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. Contract 091575-A-Q1. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

One of the unresolved problems in climate and numerical weather prediction is the treatment of cloudiness. In the real atmosphere, clouds are interactively linked to dynamical, hydrological, turbulent, and radiative processes over scales ranging from the microphysics of cloud particles to the synoptic and planetary scales of extensive multi-layered clouds. In current general circulation models (GCMs), clouds are not related to the hydrological cycle; they exist only for their direct impact on the radiation fields, and their characteristics (horizontal cover, height, optical properties) are either held constant or diagnosed from a limited set of parameters. Many modelers have relied on resolvable-scale relative humidity for diagnosing non-convective cloudiness. Methods for linking clouds to the hydrological cycle or to the turbulent processes in GCMs are still in their infancy, although it is possible that liquid water will be explicitly predicted in the next generation of GCMs. Few comparisons of observed clouds and related relative humidity fields have actually been performed so far because of the lack of adequate cloud climatologies and atmospheric data sets allowing one to make verifications. The recent availability of the International Satellite Cloud Climatology Project (ISCCP) data sets, a consistent and global cloud climatology, is of great interest for climate research; however, the resulting cloud climatology (consisting of 30-day means of cloud characteristics averaged over approximately [250 km^2]) may not be sufficient for validating cloud generation schemes. The comparison of model-generated parameters associated with observed cloudiness requires a more detailed approach: for example, model-generated relative humidity must be compared with observed cloudiness for a variety of meteorological situations, and the results must be examined in terms of physically significant and predictable parameters.

24466 (CONF-940277–, pp. 75-80) **MODTRAN3: Suitability as a flux-divergence code.** Anderson, G.P. (Phillips Lab., Hanscom Air Force Base, MA (United States)); Chetwynd, J.H.; Wang, J.; Hall, L.A.; Kneizys, F.X.; Kimball, L.M.; Bernstein, L.; Acharya, P.; Berk, A.; Robertson, D.C. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The Moderate Resolution Atmospheric Radiance and Transmittance Model (MODTRAN3) is the developmental version of MODTRAN and MODTRAN2. The Geophysics Directorate, Phillips Laboratory, released a beta version of this model in October 1994. It encompasses all the capabilities of LOWTRAN7, the historic 20 cm^{-1} resolution (full width at half maximum, FWHM) radiance code, but incorporates a much more sensitive molecular band model with 2 cm^{-1} resolution. The band model is based directly upon the HITRAN spectral parameters, including both temperature and pressure (line shape) dependencies. Validation against full Voigt line-by-line calculations (e.g., FASCODE) has shown excellent agreement. In addition, simple timing runs demonstrate potential improvement of more than a factor of 100 for a typical 500 cm^{-1} spectral interval and comparable vertical layering. Not only is MODTRAN an excellent band model for "full path" calculations (that is, radiance and/or transmittance from point A to point B), but it replicates layer-specific quantities to a very high degree of accuracy. Such layer quantities, derived from ratios and differences of longer path MODTRAN calculations from point A to adjacent layer boundaries, can be used to provide inversion algorithm weighting functions or similarly formulated quantities. One of the most exciting new applications is the rapid calculation of reliable IR cooling rates, including species, altitude, and spectral distinctions, as well as the standard spectrally integrated quantities. Comparisons with prior line-by-line cooling rate calculations are excellent, and the techniques can be extended to incorporate global climatologies of both standard and trace atmospheric species.

24467 (CONF-940277–, pp. 85-89) **Radiation impacts on global climate models.** Baer, F. (Univ. of Maryland, College Park, MD (United States)); Arsky, N.; Rocque, K. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Climate models are driven by forcing, and these forces are seen primarily by the thermal field in general circulation models (GCMs). The major forces that affect the thermal field are longwave radiative (LWR) heating, shortwave radiative (SWR) heating, and convection (cumulus, etc.). These forcing effects are cycled through the thermal field to the motion field by nonlinear transfer. The dependent variables - in particular , temperature, moisture and clouds - evolve in time in a model and determine the subsequent forcing. If the dependent variables are not accurately calculated in space and time, the forcing functions will be adversely affected.It is thus imperative to determine how sensitive these forces are to the input variables. The authors tested the sensitivity of various LWR heating algorithms taken from general circulation models . The algorithms were tested on a variety of data profiles to cover different geographic regions and seasons.

24468 (CONF-940277–, pp. 91-94) **Measurements and modeling of the effect of convective clouds on the upper tropospheric moisture budget.** Bisson, S.E. (Sandia National Labs., Livermore, CA (United States)); Goldsmith, J.E.M.; Del Genio, A.D. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The goal of this study is to determine the upper tropospheric moisture budget associated with convective events and, in particular, to extend process models to higher altitudes than have been achieved previously. Although upper tropospheric moisture concentrations are several orders of magnitude lower than those near the surface, upper tropospheric moisture exerts an important influence on climate. On a per-molecule basis, greenhouse absorption due to water vapor is about one hundred times more effective at high altitudes than at low altitudes. Several one-dimensional radiative convective models have been used to demonstrate the importance of upper tropospheric moisture on climate. These models show that for a given fractional increase in water vapor at a given altitude, the response or change in surface temperature is qualitatively the same. Figure 1 shows the change in surface temperature for a 50% increase of the specific humidity in a 40-mbar layer in clear skies. At present, considerable controversy exists over the nature of the vertical redistribution of water vapor in a changing climate, particularly the distribution of water vapor in the upper troposphere.

Because suitable data are lacking, this controversy is also reflected in the cumulus parameterization schemes currently used in models. Understanding upper tropospheric moistening processes is therefore of prime importance in addressing the water vapor feedback question.

24469 (CONF-940277–, pp. 95-98) **Factors influencing the parameterization of tropical anvils within general circulation models.** Bradley, M.M. (Lawrence Livermore National Lab., CA (United States)); Chin, H.N.S. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The overall goal of this project is to improve the representation in general circulation models (GCMs) of anvil clouds and their effects. We have concentrated on an important portion of the overall goal; the evolution of cumulus-generated anvil clouds and their effects on the large-scale environment. Because of the large range of spatial and temporal scales involved, we have been using a multi-scale approach. For the early-time generation and development of the cirrus anvil, we are using a cloud-scale model with a horizontal resolution of 1-2 kilometers, while for the transport of anvils by the large-scale flow, we are using a mesoscale model with a horizontal resolution of 10-40 kilometers. The eventual goal is to use the information obtained from these simulations, together with available observations, to develop an improved cloud parameterization for use in GCMs. The cloud-scale simulation of a midlatitude squall line case and the mesoscale study of a tropical anvil using an anvil generator were presented at the last Atmospheric Radiation Measurement (ARM) science team meeting. This paper concentrates on the cloud-scale study of a tropical squall line. Results are compared with its midlatitude counter-parts to further our understanding of the formation mechanism of anvil clouds and the sensitivity of radiation to their optical properties.

24470 (CONF-940277–, pp. 99) **Comparison of stochastic radiation transfer predictions with multi-filter rotating shadowband radiometer data.** Byrne, N. (Science Applications International Corp., San Diego, CA (United States)); Ramanathan, G.; Malvagi, F. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. There are many proposed models for estimating the effects of broken cloud on radiative transfer in the context of a general circulation model (GCM). These schemes are required to be very fast and to require only a modest amount of met data. To be worthy of consideration, they must offer improvement over a simple fractional cloud cover (FCC) prediction. We describe the initial results of the use of multi-filter rotating shadowband radiometer (MFRSR) data from the Atmospheric Radiation Measurement (ARM) Program to compare a model we have proposed (the simplest Pomraning-Levermore [PL] equation set) with FCC. Because the required sitewide solar fluxes are not yet available, we have used five successive days in late May 1993 with roughly similar climatology at the (only available) instrument to stand for five separate readings of the same day. The cloud size data required for PL and the fractional area coverage required for FCC were taken from Geostationary Operational Environmental Satellite (GOES) observations for the same period. As it turned out, conditions for this particular period were such that the two methods give indistinguishable predictions, but the method is established and the expected availability of much more data in the near future should allow definitive results.

24471 (CONF-940277–, pp. 101-109) **Residual analysis of surface spectral radiances between instrument observations and line-by-line calculations.** Clough, S.A. (Atmospheric and Environmental Research, Inc., Cambridge, MA (United States)); Brown, P.D.; Miller, N.E.; Liljegren, J.C.; Shippert, T.R. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. DOE Contract FG02-90ER61064. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The evaluation and improvement of radiative transfer calculations are essential to attain improved performance of general circulation models (GCMs) for climate change applications. The focus of the study described here is a critical assessment of a radiative transfer experiment conducted under the Department of Energy's Atmospheric Radiation Measurement Program (ARM). The three principal components of the study are (1) ground-based measurement of the spectral radiances, (2)characterization of the atmospheric state associated with the radiating column, and (3) evaluation of the line-by-line radiative transfer model. The experiment will be continuous (once per hour) and will be conducted over an extended period of time (up to 10 years), important requirements for climate change applications. With respect to global coverage, the first experiment is being conducted in the Southern Great Plains of the United States, with subsequent sites planned for climatologically diverse locations. The initial focus of the experiment is on longwave radiative transfer for clear sky; we plan to extend the approach to include the shortwave and atmospheres with clouds and aerosols. Evaluation of the present radiation modeling capability is best achieved by using statistical analyses of the residuals between observed and calculated spectral radiances. Spectral radiances are calculated using the Line by Line Radiative Transfer Model (LBLRTM) in conjunction with the HITRAN92 line parameter database. Radiance residuals provide a direct indication of all three components of the experiment by physical process. In the context of the present study, an example of a physical process is the radiance from spectral lines in a specific vibration-rotation band of water vapor.

24472 (CONF-940277–, pp. 111-113) **Development of a scheme for parameterizing the effects of cloud condensation nuclei on stratocumulus cloud albedo.** Cotton, W.R. (Colorado State Univ., Fort Collins, CO (United States)); Stevens, B.; Duda, D.; Stephens, G.L. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. Contract NIGEC-91-S01. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to develop a scheme for parameterizing the effects of varying concentrations of cloud condensation nuclei (CCN) on stratocumulus cloud albedo for use in global climate models. The challenges in achieving this goal are: CCNs are not a horizontally and vertically uniform species, but vary depending upon differential horizontal advection of differing CCN sources and upon local conditions (e.g., CCN formation by gas-to-particle conversion and cloud removal). CCNs are probably as variable as water vapor. The peak supersaturations that determine the activation of CCN and resultant aerosol and cloud droplet distributions are a function of cloud updraft and downdrafts on scales of a few hundred meters with magnitudes of a few meters per second. These scales cannot be represented properly either with large-scale grid-resolvable ascent rates of the order of 0.01 m/s or by eddy diffusion models. Cloud albedo is a strong function of the cloud macrostructure (holes, hills, troughs in cloud structure) and of the liquid water paths and aerosol/hydrometeor spectra. The aerosol/hydrometeor spectra, in turn, are not only a function of nucleation of cloud droplets at cloud base on resident CCN in the atmospheric boundary layer (ABL), but also the entrainment of CCN from above the capping inversion and the formation of drizzle. (Entrainment is one of the most difficult processes to model in the cloud-topped boundary layer [CTBL]). Drizzle formation is a complicated function of the CCN spectra, especially giant and ultra-giant aerosol, cloud liquid water contents, mixing processes, and the time scales of cloud drafts which are determined by the strengths and depths of cloud drafts.

24473 (CONF-940277–, pp. 119-125) **Modeling and observing the optical thickness of low clouds.** Del Genio, A.D. (Goddard Institute for Space Studies, New York, NY (United States)); Yao, M.S.; Kovari, W.; Wolf, A.B. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

A substantial portion of the disagreement in cloud feedback among various general circulation models (GCMs) can be traced to the models differing representations of the optical thickness of low-level clouds. Implicit cloud optical thickness feedback arises when the optical properties are prescribed as a function of height, because cloud height typically increases in model simulations of a warming climate. If the optical thickness decreases with height, a positive low cloud optics feedback results. Diagnostic parameterizations, in which optical thickness is assumed to increase with temperature based on, e.g., a calculation of the adiabatic liquid water content of a moist lifted air parcel, produce a negative cloud optics feedback because the albedo effect dominates the greenhouse effect for low-level clouds. Prognostic schemes, in which cloud liquid/ice water is predicted as a function of time based on a cloud water budget and the optical properties diagnosed from the cloud water content, can produce either positive, neutral, or negative cloud optics feedbacks because such schemes incorporate both sources and sinks of cloud water. To date, no observational or theoretical consensus has emerged on the temperature dependence of the optical thickness of low clouds. Aircraft observations over the former Soviet Union indicate that the liquid water content of low and middle clouds increases with temperature except perhaps at the warmest temperatures. Researchers used this indication as the basis of an optical thickness feedback simulation in a one-dimensional radiative-convective (1DRC) model, illustrating the potentially large negative cloud optics feedback. Others used simple thermodynamic arguments to calculate the temperature dependence of adiabatic liquid water content, with similar implications for low cloud optical thickness feedback. There is no obvious liquid water path dependence on temperature in satellite microwave measurements over the North Atlantic.

24474 (CONF-940277–, pp. 127-130) **Mesoscale simulations of convective systems with data assimilation during June 1993 in the Southern Great Plains.** Dudhia, J. (National Center for Atmospheric Research, Boulder, CO (United States)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. DOE Contract AI05-90ER61070. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

An intensive observation period (IOP) took place at the Southern Great Plains Cloud and Radiation Testbed (CART) site from June 16-26,1993. Additional observations came from two integrated sounding systems (ISSs) and three National Center for Atmospheric Research (NCAR) cross-chain loran atmospheric sounding system (CLASS) sites to complement the central CART site and the seven National Weather Service (NWS) profilers of the demonstration network in the area. The NCAR/Penn State Mesoscale Model (MM5) has been used to simulate this period on a 60-km domain with 20- and 6.67-km nests centered on Lamont, Oklahoma. Simulations are being run with data assimilated by the nudging technique to incorporate upper-air and surface data from a variety of platforms. One goal of this work is to use all the available data collected in the Southern Great Plains CART area in conjunction with a continuously running mesoscale model to provide complete hourly datasets of the wind, temperature, humidity, and cloud distributions at high resolution. The model maintains dynamical consistency between the fields, while the data correct for model biases that may occur during long-term simulations and provide boundary conditions. In this study the feasibility of driving the model with surface data, rawinsonde data, profiler winds, microwave radiometer moisture data, and radio-acoustic sounding system (RASS) temperatures is being demonstrated. The dataset provided will be a valuable resource for comparison with general circulation model (GCM) parameterizations of cloud and radiation fields, as well as for mesoscale studies of convective events during this period.

24475 (CONF-940277–, pp. 131-135) **Surface flux intercomparison between the MM5 model and observations during the storm-scale observations regional measurement program - fronts experiment systems test 1992.** Dudhia, J. (National Center for Atmospheric Research, Boulder, CO (United States)); Oncley, S.P. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. DOE Contract AI05-90ER61070. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Mesoscale model 5 (MM5) is being used as a data assimilation tool for the Atmospheric Radiation Measurement (ARM) Program. There is a need to verify that the model physics is consistent with observations under a range of conditions. Surface fluxes of heat, moisture, and momentum are a particular area of uncertainty in the model owing to their dependence on surface properties, some of which are time-dependent. The National Center for Atmospheric Research (NCAR) Atmosphere-Surface Turbulent Exchange Research (ASTER) facility provides direct measurements of the fluxes near the surface by means of three-dimensional sonic anemometers collocated with fast-response temperature and humidity sensors. Additionally aircraft data from a low-flying King aircraft have been taken over the ASTER site. The primary objective is to detect any systematic errors in the MM5 surface flux formulation that could have adverse effects on the model data assimilation and, thence, to suggest corrections that help avoid such inaccuracies.

24476 (CONF-940277–, pp. 137-139) **Cloud microphysical and radiative properties measured by combined lidar, radar, and infrared radiometer.** Eberhard, W.L. (National Oceanic and Atmospheric Administration, Boulder, CO (United States)); Intrieri, J.M.; Chan, K.P.; Feingold, G. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The goal of our research in the Instrument Development Program (IDP) is to provide experimental descriptions of the bulk, microphysical, and radiative parameters of clouds (especially cirrus) and the relationships between these properties, for use in developing and validating climate models. The strategy of the Atmospheric Lidar Division of our laboratory is to develop remote sensing techniques to simultaneously measure important cloud parameters and to apply these new methods and older ones in case studies and statistical investigations. Our division participated with the University of Utah on technique development during the first three years of IDP including field tests locally and at FIRE II. The Atmospheric Radiation Measurement (ARM) Program also helped fund demonstration of new technology at the Atlantic Stratocumulus Transition EXperiment (ASTEX). Our current research under a new, independent grant comprises four tasks, which are summarized.

24477 (CONF-940277–, pp. 141-144) **Radar/radiometer retrievals of cloud liquid water and drizzle: Analysis using data from a three-dimensional large eddy simulation of marine stratocumulus clouds.** Feingold, G. (Univ. of Colorado, Boulder, CO (United States)); Frisch, A.S.; Stevens, B.; Cotton, W.R. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. Contract 164514-A-91. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Marine stratocumulus clouds are believed to play an important role in the earth's energy budget through their effect on the radiation budget. To evaluate the impact of stratocumulus clouds on climate, long-term cloud monitoring with extensive spatial coverage is imperative. Central to this problem are measurements of cloud liquid water and drizzle. This need prompted the National Oceanic and Atmospheric Administration's (NOAA) Environmental Technology Laboratory to develop techniques for retrieving cloud liquid water content and drizzle characteristics using a K_α-band Doppler radar and microwave radiometer. The instruments were deployed on the island of Porto Santo in the Madeiras during the recent Atlantic Stratocumulus Transition EXperiment (ASTEX), June 1992. Unfortunately, there were no useful overflights of the island, and there are no direct in situ measurements against which to compare the remote measurements. In this paper, we will use a data set generated by a three-dimensional (3-D) large eddy simulation (LES) model as a surrogate for real data. The model results presented do not represent an ASTEX case study; they are simply synthetic data of a marine stratocumulus capped boundary layer which are used to analyze the behavior of the remote sensing retrievals. The model is the Regional Atmospheric Modeling System (RAMS) developed at Colorado State University. The version used includes explicit treatment of cloud condensation nucleus and droplet size spectra. Because RAMS is able to resolve droplet size distributions, it is ideal for comparing various integrated moments of the distribution (e.g., LWC, Z, etc.) with similar parameters measured either in situ or by remote sensors. Model-derived information on droplet spectra and vertical velocities is used to calculate radar reflectivity factors, Doppler velocity spectra, and integrated liquid water paths (LWP). These parameters are then used as input to the retrieval method.

24478 (CONF-940277–, pp. 145-148) **Scanning Raman lidar measurements of atmospheric water vapor and aerosols.** Ferrare, R.A. (Hughes STX Corp., Lanham, MD (United States)); Evans, K.D.; Melfi, S.H.; Whiteman, D.N. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The principal objective of the Department of Energy's (DOE) Atmospheric Radiation Measurement Program (ARM) is to develop a better understanding of the atmospheric radiative balance in order to improve the parameterization of radiative processes in general circulation models (GCMs) which are used to study climate change. Meeting this objective requires detailed measurements of both water vapor and aerosols since these atmospheric constituents affect the radiation balance directly, through scattering and absorption of solar and infrared radiation, and indirectly, through their roles in cloud formation and dissipation. Over the past several years, we have been investigating how the scanning Raman lidar developed at the NASA/Goddard Space Flight Center (GSFC) can provide the water vapor and aerosol measurements necessary for such modeling. The lidar system has provided frequent, high resolution profiles of atmospheric water vapor and aerosols in nighttime operations during two recent field experiments. The first experiment was ATMIS-11 (Atmospheric Moisture Intercomparison Study) conducted in July-August 1992, and the second was the Convection and Moisture Experiment (CAMEX) conducted during September-October 1993. We present a brief description of the lidar system and examples of the water vapor and aerosol measurements acquired during these experiments.

24479 (CONF-940277–, pp. 149-150) **Stratus cloud measurements with a K_α-band Doppler radar and a microwave radiometer.** Frisch, A.S. (National Oceanic and Atmospheric Administration, Boulder, CO (United States)); Fairall, C.W.; Snider, J.B.; Lenschow, D.H. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. Contract 164514-a-91. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The goal of the Atlantic Stratocumulus Transition Experiment (ASTEX) held in the North Atlantic during June 1992 was to determine the physical reasons for the transition from stratocumulus to broken clouds. Some possible reasons for this transition were such things as cloud top entrainment instability and the decoupling effects of drizzle. As part of this experiment, the Environmental Technology Laboratory's cloud sensing Doppler radar and three-channel microwave radiometer were deployed in the island of Porto Santo in the Madeira Islands of Portugal along with a carbon dioxide Doppler lider. Drizzle properties in stratus were examined using a log-normal droplet distribution model that related the model's three parameters to the first three Doppler spectral moments of the cloud radar. With these moments, we are then able to compute the drizzle droplet concentration, modal radius, liquid water, and liquid water flux as a function of height.

24480 (CONF-940277–, pp. 151-155) **A stratiform cloud parameterization for general circulation models.** Ghan, S.J. (Pacific Northwest Lab., Richland, WA (United States)); Leung, L.R.; Chuang, C.C.; Penner, J.E.; McCaa, J. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. DOE Contract AC06-76RL01830. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The crude treatment of clouds in general circulation models (GCMs) is widely recognized as a major limitation in applying these models to predictions of global climate change. The purpose of this project is to develop a parameterization for stratiform clouds in GCMs that expresses stratiform clouds in terms of bulk microphysical properties and their subgrid variability. In this parameterization, precipitating cloud species are distinguished from non-precipitating species, and the liquid phase is distinguished from the ice phase. The size of the non-precipitating cloud particles (which influences the cloud radiative properties and the conversion of non-precipitating cloud species to precipitating species) is determined by predicting both the mass and number concentrations of each species.

24481 (CONF-940277–, pp. 157-159) **Implementation of Raman lidar for profiling of atmospheric water vapor and aerosols at the Southern Great Plains Cloud and Radiation Testbed Site.** Goldsmith, J.E.M. (Sandia National Labs., Livermore, CA (United States)); Bisson, S.E.; Blair, F.H.; Whiteman, D.N.; Melfi, S.H.; Ferrare, R.A. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

There are clearly identified scientific requirements for continuous profiling of atmospheric water vapor at the Southern Great Plains (SGP) Cloud and Radiation Testbed (CART) site. Research conducted at several laboratories, including our own collaboration in a previous Instrument Development Project for the Atmospheric Radiation Measurement (ARM) Program, has demonstrated the suitability of Raman lidar for providing measurements that are an excellent match to those requirements. We are currently building a rugged Raman lidar system that will reside permanently at the CART site and that is computer-automated to reduce the requirements for operator interaction. In addition to the design goal of profiling water vapor through most of the troposphere during nighttime and through the boundary layer during daytime, the lidar is intended to provide quantitative characterizations of aerosols and clouds, including depolarization measurements for particle phase studies. Raman lidar systems detect selected species by monitoring the wavelength-shifted molecular return produced by Raman scattering from the chosen molecule or molecules. For water-vapor measurements, the nitrogen Raman signal is observed simultaneously with the water-vapor Raman signal; proper ratioing of the signals yields the water-vapor mixing ratio. Similarly, when the

backscatter signal at the laser wavelength (which contains contributions from both Rayleigh and aerosol scattering) is also recorded simultaneously, the ratio of the backscatter signal to the nitrogen Raman signal yields a quantitative measurement of the aerosol scattering ratio. A variety of aerosol and cloud parameters can be derived from this measurement. In aerosol-free regions of the atmosphere, temperature profiles can be derived from the density measurements obtained from the nitrogen Raman signal.

24482 (CONF-940277–, pp. 161-165) **On the fundamental role of tropospheric radiative cooling on the diurnal cycle of intense tropical convection.** Gray, W.M. (Colorado State Univ., Ft. Collins, CO (United States)); Sheaffer, J.D.; Thorson, W. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. DOE Contract FG03-94ER61772. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The atmosphere performs a day versus night (DVN) radiation experiment each 24 hours. This research seeks to more accurately describe the main aspects of the diurnally varying heating, moisture, rainfall, circulation, cloudiness and related cycles of the tropical atmosphere. These studies focus on the following areas: Revised diagnostic studies of the diurnal cycle, arising in part from the principal investigator's prior work in the area, but expanded to include the vast new and improved tropical data bases now available; New initiatives in the analysis of the diurnal cycle on larger space scales and its variability in interannual time frames; Participation in the TWP-CART field program; and, Collaborative interactions with general circulation model (GCM) research groups to better maintain the focus of our work on mutually beneficial outcomes.

24483 (CONF-940277–, pp. 167-171) **Testing of Newtonian nudging technique in data assimilation on the meso-beta-scale.** Guo, Y.R. (National Center for Atmospheric Research, Boulder, CO (United States)); Kuo, Y.H. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The Newtonian nudging technique is a practical and flexible method for synoptic scale and meso-α-scale data assimilation. Application of the nudging technique for meso-β-scale data assimilation has been rare. As part of the development of an Integrated Data Assimilation and Sounding System in support of the ARM measurement program, the authors have experimented with the Newtonian nudging technique for meso-β-scale data assimilation. With the meso-β-scale dataset (station separation is 90 km) available in WISP/ARM-91, the optimal nudging coefficient G is around 1×10^{-3} s^{-1} for a high-resolution (5 km) mesoscale model. A good choice of radius of influence R is a value close to the station separation. In this study, R = 50 km gives smaller errors, and neither the noise parameter nor the wind rms errors are sensitive to the radius of influence for $R \geq 50$ km.

24484 (CONF-940277–, pp. 173-180) **Toward an operational water vapor remote sensing system using the global positioning system.** Gutman, S.I. (National Oceanic and Atmospheric Administration, Boulder, CO (United States)); Chadwick, R.B.; Wolf, d.W.; Simon, A.; Van Hove, T.; Rocken, C. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Water vapor is one of the most important constituents of the free atmosphere since it is the principal mechanism by which moisture and latent heat are transported and cause weather. Recent experiments have demonstrated that data from Global Positioning System (GPS) satellites can be used to monitor precipitable water vapor (PWV) with millimeter accuracy and sub-hourly temporal resolution. Major advantages of GPS-based systems include the following: they work under virtually all weather conditions; individual systems do not have to be calibrated; and, they are relatively inexpensive.

24485 (CONF-940277–, pp. 181-184) **Comparisons of brightness temperature measurements and calculations obtained during the spectral radiance experiment.** Han, Y. (National Oceanic and Atmospheric Administration, Boulder, CO (United States)); Snider, J.B.; Westwater, E.R.; Melfi, S.H.; Ferrare, R.A. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

In radiometric remote sensing of the atmosphere, the ability to calculate radiances from underlying state variables is fundamental. To infer temperature and water vapor profiles from satellite- or ground-based radiometers, one must determine cloud-free regions and then calculate clear-sky radiance emerging from the top of the earth's atmosphere from the underlying profiles of temperature and water vapor. Equally important is the validation of the radiometric retrievals. Usually such validation is made by comparing retrievals with profiles derived from other sensors. Traditionally, such "forward model" calculations and validations have coupled radiosonde observations of the state variables with detailed absorption and radiative transfer models. However, for a variety of reasons, radiosonde moisture measurements are not always satisfactory, especially during low humidity conditions or when there are large horizontal or temporal gradients in the humidity structure. A recent alternative to radiosonde moisture measurements is Raman lidar. The Raman lidar provides humidity measurements with temporal and spatial resolution far superior to radiosonde measurements. In November-December 1991, a substantial number of remote sensor and in-situ instruments were operated together in Coffeyville, Kansas, during the First ISCCP Regional Experiment (FIRE) 11. Included in the suite of instruments were (1) the Environmental Technology Laboratory's (ETL) three-channel microwave radiometer, (2) the NASA/Goddard Space Flight Center's (GSFC) Raman lidar, (3) ETL's radio acoustic sounding system (RASS), and (4) frequent research-quality radiosondes. The Raman lidar operated only at night, and this portion of the experiment focused on cloud-free conditions. In this presentation, we present results of simultaneous microwave radiometer measurements with collocated Raman lidar measurements of water vapor over 10 nights during the experiments.

24486 (CONF-940277–, pp. 185-191) **Vegetation forcing and convective motion.** Hong, X. (North Carolina State Univ., Raleigh, NC (United States)); Leach, M.J.; Raman, S. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. Contract 091575-A-Q1. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

A large irrigated vegetation area in a semiarid or relatively dry location is a strong surface forcing of thermal circulations. Several observational studies have found that such thermally induced mesoscale circulation may contribute to the triggering and development of convective clouds. In the western United States, extensive areas of irrigated farmland are surrounded by hot, dry surfaces, such as a steppe. Substantial gradients of sensible heating in the horizontal direction lead to a "farm breeze" circulation from the cooler agricultural area to the warmer steppes found at Boardman, Oregon. These thermally forced circulations may trigger convection by the related convergence and updraft motion under favorable atmospheric conditions. The role of vegetative covering in convective motion is investigated using a mesoscale numerical model. Two- and three-dimensional simulations are described. The effects of atmospheric stability, moisture in the lower atmosphere, moisture in the upper atmosphere, and horizontal heating scale on thermally induced clouds are studied. The horizontal scale of inhomogeneity

is also studied using the two-dimensional model. Finally, a realistic vegetation distribution similar to that of the Boardman Regional Flux Experiment is used in the three-dimensional simulations.

24487 (CONF-940277–, pp. 193-197) **The effects of arctic stratus clouds on the solar energy budget in the atmosphere-sea ice-ocean system.** Jin, Z. (Univ. of Alaska, Fairbanks, AK (United States)); Stamnes, K.; Zak, B.D. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

This article describes a comprehensive radiative transfer model pertinent to the atmosphere-sea ice-ocean system. The main features of the model include: The atmosphere, sea ice, and ocean each represented by a sufficient number of layers to resolve the change in the optical properties of each stratum; An appropriate quadrature structure to take into account the total reflection at the air-ice or air-water interface, as well as to solve the radiative transfer equation in the coupled system consistently; Provision for a different number of streams (quadrature points) in the atmosphere, ice, and ocean, chosen based on the optical properties in each stratum and the computational accuracy method.

24488 (CONF-940277–, pp. 199-201) **Development of a hybrid cloud parameterization for general circulation models.** Kao, C.Y.J. (Los Alamos National Lab., NM (United States)); Kristjansson, J.E.; Langley, D.L. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

We have developed a cloud package with state-of-the-art physical schemes that can parameterize low-level stratus or stratocumulus, penetrative cumulus, and high-level cirrus. Such parameterizations will improve cloud simulations in general circulation models (GCMs). The principal tool in this development comprises the physically based Arakawa-Schubert scheme for convective clouds and the Sundqvist scheme for layered, nonconvective clouds. The term "hybrid" addresses the fact that the generation of high-attitude layered clouds can be associated with preexisting convective clouds. Overall, the cloud parameterization package developed should better determine cloud heating and drying effects in the thermodynamic budget, realistic precipitation patterns, cloud coverage and liquid/ice water content for radiation purposes, and the cloud-induced transport and turbulent diffusion for atmospheric trace gases.

24489 (CONF-940277–, pp. 203-206) **Atmospheric emitted radiance interferometer data analysis methods.** Knuteson, R.O. (Univ. of Wisconsin, Madison, WI (United States)); Smith, W.L.; Ackerman, S.A.; Revercomb, H.E.; Woolf, H.; Howell, H. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Data from the Atmospheric Emitted Radiance Interferometer (AERI) have been analyzed for the Atmospheric Radiation Measurement (ARM) Program's Fourier Transform Data Analysis Tools science team project under the direction of William L. Smith of the University of Wisconsin-Madison. The data consist of observations of the downwelling infrared emission at the surface from gaseous atmospheric constituents and from cloud and particulate aerosols. The observations are at 0.5 cm-1 spectral resolution over the spectral range from 500 to 3000 cm-1. Observations from the Southern Great Plains (SGP) Cloud and Radiation Testbed (CART) have been made with an AERI prototype since March 1993. A small sample of the data collected by the AERI at the SGP CART site is given. These CART observations, combined with data collected during other field experiments, have been used to develop techniques for extracting valuable information from the infrared spectra. The science objectives of this data analysis include (1) addressing issues in radiative transfer modeling, (2) modeling cloud microphysical properties, (3) inferring cloud emissivity and reflectivity, (4) classifying spectral content, and (5) retrieving boundary layer vertical profiles of atmospheric temperature and water vapor.

24490 (CONF-940277–, pp. 207-210) **Evaluation of two radiative parameterizations using a three-dimensional large-eddy simulation microphysical model.** Kogan, Y.L. (Univ. of Oklahoma, Norman, OK (United States)); Kogan, Z.N.; Lilly, D.K.; Khairoutdinov, M.F. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Stratocumulus clouds in the marine boundary layer exert a tremendous impact on the planetary radiation balance because of their persistence and large cover. Even small biases in the representation of their radiative parameters can produce large errors in the simulated planetary radiation balance. General circulation models (GCMs) and climate models most commonly use two parameterizations of cloud optical depth. The first employs as input parameters the climatological or in some other way averaged cloud droplet effective radius and liquid water path. The second concerns droplet concentration, mean droplet radius and cloud geometrical thickness. Both parameterizations are obtained from a general theoretical expression for cloud optical depth. This paper contrasts these two parameterizations with the general theoretical definition, using a set of cloud drop distribution functions generated by the CIMMS three-dimensional large-eddy simulation (LES) stratocumulus cloud microphysical model.

24491 (CONF-940277–, pp. 211) **Parameterization of thin mid-level stratiform clouds.** Krueger, S.K. (Univ. of Utah, Salt Lake City, UT (United States)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Thin mid-level stratiform clouds have received little attention from either modelers or observational programs, yet these clouds cover large portions of the earth and significantly affect the radiation fields.The ARM/CART program offers an unprecedented opportunity to greatly improve our ability to parameterize the radiative effects of these important clouds in climate models. The authors plan to develop and test a physically based parameterization for altocumulus layers for use in GCMs.

24492 (CONF-940277–, pp. 213-215) **Long-pathlength infrared absorption measurements in the 8- to 14-μm atmospheric window: Self-broadening coefficient data.** Kulp, T.J. (Lawrence Livermore National Lab., CA (United States)); Shinn, J. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The accurate characterization of the latent infrared (IR) absorption in the atmospheric window regions continues to be an area of research interest for the global climate modeling community. In the window between 8 and 14 μm, this absorption can be attributed primarily to water vapor. It consists of (1) weak lines originating from the edge of the water vapor pure rotational band (at low wavenumbers) and the trailing P-branch of the ν_2 rovibrational band (at the high-wavenumber boundary of the window); and (2) the water vapor continuum absorption. The goal of our project has been to improve our quantitative and physical understanding of both of these absorption processes. Specifically, our immediate

aims are to fill gaps in the experimental radiative transfer databases pertaining to the line parameters (i.e., line intensities and broadening coefficients) and to the self- and foreign-broadened water vapor continuum. To accomplish our goals, we have made long-pathlength absorption measurements using a Fourier transform infrared spectrometer (FTIR) (for the continuum and line measurements, at low resolution) and a tunable diode laser absorption spectrometer (TDLAS) (for the line measurements, at high resolution). These measurements were made on gas samples contained in a 400-m maximum pathlength Horn Pimentel multipass cell designed and constructed for this project.

24493 (CONF-940277–, pp. 223-226) **The effects of radiative transfer on low-level cyclogenesis.** Leach, M.J. (North Carolina State Univ., Raleigh, NC (United States)); Raman, S. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Many investigators have documented the role that thermodynamic forcing due to radiative flux divergence plays in the enhancement or generation of circulation. Most of these studies involve large-scale systems, small-scale systems such as thunderstorms, and squall lines. The generation of circulation on large scales results from the creation of divergence in the upper troposphere and the maintenance of low-level potentially unstable air, and the maintenance of baroclinicity throughout the atmosphere. On smaller scales, radiative flux divergence acts similarly. In the thunderstorms and squall lines, the radiative forcing acts as a pump, increasing the divergence at the top of the storm systems and increasing the updraft velocity and the intensity of inflow at mid-levels in the storm systems. Other researchers have examined the role of surface processes and low-level baroclinicity in east coast cyclogenesis. In this paper, we examine the interactive role that radiative flux divergence, clouds, and surface processes play in low-level cyclogenesis and the creation or maintenance of the boundary layer baroclinicity.

24494 (CONF-940277–, pp. 227-231) **Design of the aerosol sampling manifold for the Southern Great Plains site.** Leifer, R. (Dept. of Energy, New York, NY (United States)); Knuth, R.H.; Guggenheim, S.F.; Lee, H.N. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

To meet the needs of the ARM program, the Environmental Measurements Laboratory (EML) has the responsibility to establish a surface aerosol measurements program at the Southern Great Plains (SGP) site in Lamont, OK. At the present time, EML has scheduled installation of five instruments at SGP: a single wavelength nephelometer, an optical particle counter (OPC), a condensation particle counter (CPC), an optical absorption monitor (OAM), and an ozone monitor. ARM's operating protocol requires that all the observational data be placed online and sent to the main computer facility in real time. EML currently maintains a computer file containing back trajectory (BT) analyses for the SGP site. These trajectories are used to characterize air mass types as they pass over the site. EML is continuing to calculate and store the resulting trajectory analyses for future use by the ARM science team.

24495 (CONF-940277–, pp. 233-236) **Single-column data assimilation for the Atmospheric Radiation Measurement Program.** Louis, J.F. (Atmospheric and Environmental Research, Inc., Cambridge, MA (United States)); Zivkovic, M. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The goal of this work is to develop a data assimilation system that will use as much of the ARM data as possible and will provide a continuous description of the atmosphere over the CART site. This would be useful for initializing and validating single-column models. The authors use a variational assimilation method. The analysis is defined as the state of the atmosphere which, over a given analysis period, is closest to the observations, weakly constrained by the equations of a model. A weak constraint means that the analyzed state obeys modified model equations, to which terms accounting for the model errors have been added. These added terms are the control variables in minimizing the difference between the model simulation and the observations.

24496 (CONF-940277–, pp. 237-240) **Sensitivity of cirrus cloud radiative properties to ice crystal size and shape in general circulation model simulations.** Mitchell, D.L. (Desert Research Institute, Reno, NV (United States)); Kristjansson, J.E.; Newman, M.J. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. Grant NA36GPO278. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Recent research has shown that the radiative properties of cirrus clouds (i.e., optical depth, albedo, emissivity) depend on the shapes and sizes of ice crystals. For instance, the cloud albedo may vary by a factor of two, depending on whether hexagonal columns or bullet rosette ice crystals are assumed for a given ice water path (IWP). This variance occurs primarily because, at sizes characteristic of cirrus clouds, bullet rosettes have less mass than columns of the same size. However, their projected areas may be comparable. Thus, for a given IWP and mean cloud ice particle size, the optical depth will be considerably greater for rosettes, since many more rosettes are required to account for the IWP than are columns. The same could be said of hexagonal plates and columns, with plates exhibiting the greater optical depth. Satellite information suggests that the albedos of tropical cirrus clouds are greater than those of midlatitude cirrus, with albedos as high as 60%-80%. The reasons for this are not understood, but might be attributed in part to differences in ice particle size and shape. For instance, in the tropical western Pacific, ice crystal size distributions in cirrus near the tropopause exhibited median mass dimensions (D_m around 30 μm) and contained planar polycrystals. Very small ice crystals (typically 10 μm, often ranging from about 2 μm - 100 μm) of indeterminate shape were sampled in anvil cirrus by an ice particle replicator in this region during the Tropical Ocean Global Atmosphere (TOGA) Coupled Ocean Atmosphere Response Experiment (COARE). If fewer columnar ice crystals were present in tropical versus midlatitude cirrus and/or sizes were smaller, tropical cirrus should exhibit greater size distribution projected area, producing greater optical depth, albedo, and emissivity for the same IWP. Smaller crystal sizes would also promote higher albedos via enhanced backscattering.

24497 (CONF-940277–, pp. 241-242) **Solar radiance transmission interferometer observations at the Southern Great Plains Cloud and Radiation Testbed site.** Murcray, F. (Univ. of Denver, CO (United States)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The prototype SORTI (SOlar Radiance Transmission Interferometer) has been collecting solar absorption spectra at the Cloud and Radiation Testbed site in the Southern Great Plains since January 1994. The instrument is equipped with two infrared detectors and has a maximum optical path difference of 280 cm, giving a spectral resolution of 0.0035 cm^{-1} (apodized) between 700 and 4000 cm^{-1} (2.5 μm to 14 μm). However, at full resolution, the maximum bandwidth is about 800 cm^{-1} per spectrum. A mercury-cadmium-telluride detector is used for the 700 to 2000 cm^{-1} region, and an indium antinomide detector is used for frequencies above 2000

cm^{-1}. A servo-controlled tracker brings solar radiation into the instrument. Full resolution spectra take less than 6 minutes. For the test period, the instrument is operated in two modes: full resolution in 4 bands (700-1300 cm^{-1}, 1900-2450 cm^{-1}, 2400-3100 cm^{-1}, and 4000-4250 cm^{-1}) 5 times per day; and 0.02 cm^{-1} resolution spectra in the same bands 11 times per day. The prototype instrument requires liquid nitrogen filling for the detectors and removal of the cover on the solar tracker. Otherwise, it is automatic. The site crew has been able to run the instrument and correct a few software problems. Data from the instrument are collected on a PC hard disk. We do not yet have a data ingest module, so the data are transferred to Denver via Internet for storage. Anyone interested can get the data from us, either by ftp or on floppy disks. An example of a small portion of the spectra from the afternoon of February 9 is shown; SORTI observations are presented.

24498 (CONF-940277–, pp. 243-245) **Cloud parameterizations in global climate models: The role of aerosols.** Penner, J.E. (Lawrence Livermore National Lab., CA (United States)); Chuang, C.C. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Aerosols influence warm clouds in two ways. First, they determine initial drop size distributions, thereby influencing the albedo of clouds. Second, they determine the lifetime of clouds, thereby possibly changing global cloud cover statistics. At the present time, neither effect of aerosols on clouds is included in general circulation models (GCMs). The goal of this project is to develop a global aerosol model and to couple it with the cloud/GCM model developed by Ghan so that the effects of aerosols on clouds can be treated in a realistic and validated manner. This model development will build on existing codes at Lawrence Livermore National Laboratory (LLNL) that are already able to describe some of the important aerosol types and their climate forcing. These codes will be extended to treat realistic sources of all aerosol types of importance. Having developed a global aerosol model, we will use measurements at Atmospheric Radiation Measurement (ARM) sites to validate the model in two ways. First, we will use our global aerosol model to study events of particular interest in the ARM data. This effort will allow us to check the accuracy of the model and its ability to reproduce events from particular time periods. Second, we will use the coupled model to study the climatology of aerosol and cloud microphysical predictions at ARM sites. This effort will allow us to check the accuracy of the model's predictions in reproducing a long time series of data. These comparison and tests should provide a stringent test of the model's completeness and prediction capabilities.

24499 (CONF-940277–, pp. 247-252) **Observations of tropical cirrus properties in the pilot radiation observation experiment using lidar and the CSIRO ARM filter radiometer.** Platt, C.M.R. (CSIRO, Victoria (Australia)); Young, S.A.; Manson, P.J.; Patterson, G.R. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

A narrow beam fast filter radiometer has been developed for the Atmospheric Radiation Measurement (ARM) Program. The radiometer is intended to operate alongside a lidar at ARM sites in a lidar/radiometer (LIRAD) configuration. The radiometer detects in three narrow bands at 8.62-, 10.86-, and 12.04-m central wavelengths in the atmospheric window. In addition, it has a variable field aperture that varies the radiance incident on the detector and also allows the field of view to be tailored to that of a lidar used in the LIRAD technique. The radiometer was deployed in the ARM Pilot Radiation Observation Experiment (PROBE) at Kavieng, Papua New Guinea in January-February 1993. The radiometer worked satisfactorily and appeared to be very stable. The radiometer was compared with a previous CSIRO radiometer and the improved performance of the ARM instrument was very evident. The ARM radiometer was also compared with a National Oceanic and Atmospheric Administration (NOAA) Environmental Technology Laboratories (ETL) interferometer and gave closely equivalent radiances. The LIRAD method was used at Kavieng to obtain the optical properties of cirrus clouds. Continuous observations of water vapor path obtained by the NOAA ETL microwave radiometer were employed to allow for the strong tropical water vapor absorption and emission. Cirrus cells that developed on one morning, independent of other clouds, had measured infrared emittances varying from <0.1 to 1.0.

24500 (CONF-940277–, pp. 253-257) **Single-column model and cumulus ensemble model simulations of GATE data.** Randall, D.A. (Colorado State Univ., Fort Collins, CO (United States)); Xu, K.M. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Our project for the Atmospheric Radiation Measurement (ARM) Program consists of developing and demonstrating improved cloud formation parameterizations using a single-column model (SCM), a cumulus ensemble model CEM and ARM data. These two models can be driven with large-scale forcing (e.g., vertical motion) as observed in ARM. Each model produces a field of clouds and the associated radiation and precipitation fields. The SCM does so through its physical parameterizations, while the CEM does so by directly simulating convective cloud circulations. The improved parameterizations tested in this way will be further tested and applied in the Colorado State University (CSU) general circulation model (GCM). To carry out this research plan, we need to attend to several tasks: develop improved cloudiness parameterizations, develop improvements to the CEM, with emphasis on cloud-radiation interactions, drive both models with the ARM data, transfer the improved parameterizations developed in this way to the CSU GCM. In this brief report, we mention our efforts and progress in each of these areas.

24501 (CONF-940277–, pp. 259-264) **Atmospheric emitted radiance interferometer: Status and water vapor continuum results.** Revercomb, H.E. (Univ. of Wisconsin, Madison, WI (United States)); Knuteson, R.O.; Smith, W.L.; Best, F.A.; Dedecker, R.G.; Howell, H.B. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Accurate and spectrally detailed observations of the thermal emission from radiatively important atmospheric gases, aerosols, and clouds are now being provided to the Atmospheric Radiation Measurement (ARM) database by the Atmospheric Emitted Radiance Interferometer (AERI) prototype at the Southern Great Plains Cloud and Radiation Testbed (CART) site. Spectra over the range from 520 to 3000 cm^{-1} (3 to 19 microns) with a resolution of 0.5 cm^{-1} are collected every 10 minutes. The observed spectra will be used for many diverse functions, including: identifying and eliminating absolute errors in calculated spectra for known atmospheric states; evaluating and improving cloud radiation calculations; characterizing the distribution and evolution of effective cloud radiative properties; studying the state parameter changes associated with the formation, evolution, and dissipation of clouds. Further very detailed spectral information (up to 0.003 cm^{-1}) is also being collected at CART from the Solar Radiance Transmission Interferometer (SORTI) prototype on clear days. The emission observations of the AERI and the absorption observations of the SORTI will be combined to enhance the spectroscopic and gas profiling information from each. The SORTI is discussed in the Murcray 1994 Science Team paper (this document). This paper deals exclusively with the AERI and includes a brief description of

the instrument deployment status and a recent spectroscopic result making use of AERI data. The general nature of the AERI spectra and the instrument design have been discussed in the 1993 ARM Science Team paper and in several conference publications.

24502 (CONF-940277–, pp. 263-264) **Radiation singularities, multiple scattering and diffusion in multifractal clouds.** Silas, P. (McGill Univ., Quebec (Canada)); Broesamlen, G.; Lovejoy, S.; Naud, C.; Schertzer, D.; Watson, B. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Many geophysical and atmospheric fields exhibit multifractal characteristics over wide ranges of scale. These findings motivate a study of transport phenomena in multifractal media, particularly diffusion. As we study the diffusion properties of one-dimensional universal multifractal resistivity fields, a relation for the diffusion exponent d(sub w) is derived and is found to depend only on K(-1), the value of the moment scaling function K(q) of the resistivity field for the q = -1 order statistical moment. This relation is subsequently verified through Monte Carlo simulations of diffusion on these systems. The study of radiative transfer in multifractal clouds is of great interest, an important application being to global climate models. In this work, we develop a formalism analogous to the multifractal singularity formalism for understanding photon scattering statistics in radiative transfer in lognormal universal multifractals, and test the results numerically.

24503 (CONF-940277–, pp. 265-274) **Warm pool physics in a coupled general circulation model.** Schneider, N. (Univ. of California, San Diego, La Jolla, CA (United States)); Barnett, T.P.; Latif, M.; Stockdale, T. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The warmest waters found in the open ocean are situated in the equatorial Indo-Pacific Ocean and are generally referred to as the warm pool (WP). Much could be said about the important climate processes that occur in the warm pool (e.g., World Climate Research Programme 1990), but perhaps it suffices to demonstrate the critical nature of this area by noting that the international scientific community recently concluded a large field program to elucidate the physics of the west Pacific warm pool. As part of the modeling effort of the Atmospheric Radiation Measurement (ARM) Program, we examine in assimulation with a coupled ocean-atmosphere general circulation model (CGCM) the seasonal migration of the warm pool, its heat budget, and its relationship with radiation and clouds. The model, developed at the Max Planck Institute of Meteorology, Hamburg, couples state-of-the-art atmospheric and ocean GCM to reproduce today's climate without flux correction.

24504 (CONF-940277–, pp. 275-277) **Triggering of boundary layer cumulus clouds over a heterogeneous surface.** Schrieber, K. (Univ. of Wisconsin, Madison, WI (United States)); Stull, R.; Zhang, Q. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. DOE Contract FG02-92ER61361. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Complex multimodal joint frequency distributions of LCL height versus θ_v in surface-layer air over a large heterogeneous surface area are modeled as the superposition of simpler mono-modal distributions. These simpler distributions, which apply to quasi-homogeneous subdomains, are approximated with bivariate distribution models. The shape of each of these modeled distributions depends on variations of the Bowen ratio and heat input forcings. These forcings are a function of the landscape, insolation, surface albedo, cloud-shading, soil moisture, and other factors that either are known as imposed boundary conditions or can be resolved or parameterized on the coarse grid scale of a global climate forecast model (GCM). This approach is motivated by the need to forecast subgrid-scale boundary-layer cumulus clouds in GCMs and in one-dimensional (single column) forecast models. The full distribution function, formed as a composite from the simpler models, can be combined with mean virtual temperature sounding information to forecast cloud onset time, cloud coverage, cloud base and heights, and cloud size distributions of an ensemble of subgrid clouds. Thus, land-use inventories or similar satellite-based observations of relative landscape amounts have the potential to be combined with distribution parameterizations such as those explored to forecast subgrid clouds. As a case study, we have analyzed aircraft data from the Hydrologic Atmospheric Pilot Experiment (HAPEX) field experiment in southwest France, which was designed to answer basic questions about GCM subgrid modeling within a horizontal grid area 100 km on a side. For this data set, we found that bivariate range-cut Gaussian or pq distribution models work equally well to approximate the simpler mono-modal distributions within quasi homogeneous subdomains.

24505 (CONF-940277–, pp. 279-282) **Millimeter-wavelength cloud measurements taken with the polarimetric cloud profiling radar system.** Sekelsky, S.M. (Univ. of Massachusetts, Amherst, MA (United States)); McIntosh, R.E. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

This paper reviews hardware for the Cloud Profiling Radar System (CPRS) and presents dual-frequency measurements that illustrate how CPRS reflectivity data may be used for cloud particle sizing. Reflectivity data show Mie scattering in the ice region, melting layer, and rain region of a stratiform cloud with light, broken precipitation. Measurements of Ze_{95} and Ze_{33} with and without precipitation show that differential attenuation is low and does not dominate the reflectivity differences. A theoretical model of Ze_{95} - Ze_{33} versus mean particle diameter for monodisperse and Gaussian size distributions of water droplets is presented to illustrate the concept of particle sizing using dual-wavelength reflectivity data.

24506 (CONF-940277–, pp. 285-286) **A one-dimensional radiative convective model with detailed cloud microphysics.** Simmons, J. (Univ. of Alaska, Fairbanks, AK (United States)); Lie-Svendsen, O.; Stamnes, K. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The Arctic is a key element in determining the radiation budget of the earth. Within the polar regions, the net radiation (incoming solar radiation minus outgoing infrared radiation) is negative. To understand the role this energy deficit plays in the overall radiation budget, one must examine the prevalent atmospheric features of the Arctic. One such feature is a persistent layer of low-altitude, stratiform clouds found over the central Arctic predominantly from April to September. These Arctic stratus clouds (ASC) modulate the earth's radiation budget by contributing to the vertical transport of heat. It is, therefore, crucial to understand the radiative properties of Arctic stratus clouds. We believe that the radiative properties of ASC are strongly coupled with their cloud microphysics. Our aim is to develop a model that will determine if this coupling is sufficient to describe the observed characteristic properties, such as lifetime and the multi-layered structure, of ASC. In addition, we hope to provide useful input to measurement programs at the Atmospheric Radiation Measurement Program's North Slope of Alaska site by isolating the measurable parameters that influence the overall radiative properties of ASC. Several features of ASC have been integrated directly into the one-dimensional model currently being developed. Generally, ASC cover large areas and exhibit reasonable horizontal homogeneity but extensive vertical inhomogeneities.

Therefore, in our model, we have assumed radiative processes are important in determining vertical structure while not considering horizontal transport. In addition, ASC occur in defined, multi-layered structures. This feature of the ASC, in conjunction with their horizontal homogeneity, justifies the use of radiative transfer theory for plane-parallel geometry with multiple scattering. Finally, ASC are generally long-lived and precipitate little during their lifetimes.

24507 (CONF-940277–, pp. 287-290) **Ground-based radiometric observations of atmospheric water for climate research.** Snider, J.B. (National Oceanic and Atmospheric Administration, Boulder, CO (United States)); Hazen, D.A.; Francavilla, A.J.; Madsen, W.B.; Jacobson, M.D. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Surface-based microwave and infrared radiometers have been employed by the National Oceanic and Atmospheric Administration's Environmental Technology Laboratory (NOAA/ETL) in climate research since 1987. The ability of these systems to operate continuously and unattended for extended periods of time has provided significant new information on atmospheric water vapor and cloud liquid. These data are being employed to improve our understanding of cloud-radiation feedback mechanisms, an understanding that is fundamental to accurate prediction of global warming. In addition to collecting data on the relation between atmospheric water substance, atmospheric transmission and cloud albedo, the radiometric observations provide groundtruth for validation and calibration of satellite measurements of water vapor and liquid water. This application is extremely important since accurate satellite monitoring of the earth is required to evaluate possible atmospheric changes that may influence global climate.

24508 (CONF-940277–, pp. 291-295) **Diagnostic analysis of cloud radiative properties.** Somerville, R.C.J. (Univ. of California, San Diego, La Jolla, CA (United States)); Iacobellis, S.F. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. DOE Contract FG03-90ER61061. A current dilemma of climate modeling is that general circulation model (GCM) results are extremely sensitive to parameterizations of certain poorly understood physical processes, most notably cloud-radiation interactions. As a result, models with different plausible parameterizations give very different results. Yet, we have no firm basis for knowing which parameterization is more nearly "correct." It is true that parameterizations are not the only shortcoming of GCMs. Our current ability to create models that will adequately simulate today's climate and predict its evolution is limited by several factors, not just by one. Some of these factors are technical, such as a lack of computer power. Nevertheless, the most critical need is for an improved physical understanding of the key physical processes. Until these processes are much better understood and until this understanding is incorporated in our models, the model results will always be subject to major uncertainties. Reducing these uncertainties so that we can have confidence in the reliability and accuracy of climate forecasts requires focused research on climate processes. Of the many physical processes involved in climate simulations, feedback from cloud-radiation interactions is currently thought to be the largest single source of uncertainty. For this reason, the Committee on Earth and Environmental Sciences continues to rank the role of clouds as the highest science priority for the U.S. Global Change Research Program. As an example of the importance of cloud-radiation feedbacks, it is noteworthy that the sensitivity of model-simulated climates to changes in atmospheric carbon dioxide concentration has undergone major fluctuations in recent years. The equilibrium global average surface temperature change in response to a carbon dioxide doubling, based on GCM results from models developed in the mid-1970s, was typically between 2°C and 3°C.

24509 (CONF-940277–, pp. 297-299) **Objective analysis schemes to monitor atmospheric radiation measurement data in near real-time.** Splitt, M. (Univ. of Oklahoma, Norman, OK (United States)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Recent work in this area by Charles Wade (1987) lays out the groundwork for monitoring data quality for projects with large networks of instruments such as the Atmospheric Radiation Measurement (ARM) Program. Wade generated objectively analyzed fields of meteorological variables (temperature, pressure, humidity, and wind) and then compared the objectively analyzed value at the sensor location with the value produced by the sensor. Wade used a Barne's objective analysis scheme to produce objective data values for a given meteorological variable (q) in two-dimensional space. The objectively analyzed value should be comparable to the actual sensor value if: (1) the variable q is appropriate for this type of objective analysis; (2) the data quality of the sensors is good; and (3) there are a significant number of sensors on which to base the objective analysis. If conditions 1 and 3 are satisfied, the objective values can be compared with the actual values to provide an estimate of the data quality.

24510 (CONF-940277–, pp. 301-304) **Solar heating in the upper ocean.** Stamnes, K. (Univ. of Alaska, Fairbanks, AK (United States)); Jin, Z. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

A discrete ordinate method has been developed to solve the radiative transfer problem in nonuniformly refracting layered media such as the atmosphere-ocean system. In the radiative transfer model for the atmosphere-ocean system the essential points are: In the ocean, region I is the total reflection region and region II is the refraction region. The downward radiation distributed over 2π steradians in the atmosphere is restricted to a cone (less than 27π steradians) upon refraction across the interface into the ocean. Photons in region 11 of the ocean may be scattered into region 1. Note, however, that photons in region I of the ocean cannot reach the atmosphere directly and vice versa. The atmosphere and region I "communicate" through the scattering process between region I and region II in the ocean. Appropriate quadrature points (streams) and weights have been chosen for the interface continuity relations. To take into account the region of total reflection in the ocean, separate angular quadrature points are adopted in addition to those used in the atmosphere and the refractive region of the sea ice and ocean. This quadrature specification automatically accounts for the refraction and reflection at the air-sea interface and solves the radiative transfer equation in the coupled system consistently. The total number of quadrature points (streams) chosen for each stratum is based on the optical properties and the accuracy required.

24511 (CONF-940277–, pp. 305-311) **Ground- and space-based humidity profiling in a cloudy atmosphere with strong elevated temperature inversion.** Stankov, B.B. (National Oceanic and Atmospheric Administration, Boulder, CO (United States)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

It has been demonstrated that improved atmospheric profiles of temperature and humidity result when proper combinations of ground-based and space-based data from multiple platforms and sensors are used as a first guess for temperature and humidity in

a physical retrieval algorithm. A wide range of platforms and sensors were used. The retrieval algorithm was provided by the International TOVS Processing Package (ITPP). In this ITPP method, all first-guess profiles are based on statistical regression analysis. It has been also demonstrated that accurate profiles of humidity and liquid water density can be obtained during cloudy conditions by combining data from ground-based remote sensors only, in the iterative retrieval scheme, provided that the vertical cloud distribution is known. In this study, we show that in more complex meteorological situations, both methods described above can be used sequentially to obtain the humidity profile that represents the thermodynamic properties of the atmosphere. On February 7 a cold front was approaching Platteville, Colorado, causing a 15°C, strong elevated inversion at 100 m above ground. The microwave radiometer showed 0.56 mm of liquid and 0.507 cm of vapor. This more complex type of meteorological situation was not encountered in either of the two previous studies. Using only the ITPP method to retrieve the temperature and humidity profiles gives a good temperature profile; however, the retrieved humidity profile shows some serious problems. For instance, it does not show that the air inside the cloud layer is saturated. Thus, we use the ground-based method to retrieve a humidity profile and then use this as a first guess in the ITPP method. The humidity profile obtained using this combined method is a significant improvement and represents the thermodynamic properties of the atmosphere very well.

24512 (CONF-940277–, pp. 313) **Characterization of the radiative properties of inhomogeneous clouds.** Stephens, G.L. (Colorado State Univ., Ft. Collins, CO (United States)); Gabriel, P.M.; Evans, K.F.; Stackhouse, P. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

One of the major sources of uncertainty in climate-based studies is related to clouds and their influence on the radiative transfer. Two broad issues are of relevance to this problem: (1) the influence of clouds on broadband radiative transfer and thus on cloud energetics and (2) the influence of clouds on spectral transfer and thus on remote sensing applications. The work described addresses key aspects of both these issues. One of the key issues in parameterizing cloud radiative processes is to account for the subgrid scale variability. A common approach for incorporating horizontal cloud inhomogeneity in radiative transfer calculations is the use of cloud fraction. We have attempted to determine the limitations of this approach by performing radiative transfer calculations applied to inhomogeneous clouds embedded in two dimensions. For solar radiation, use of cloud fraction leads to non-unique domain averaged albedos; exhibiting significant variations. We have developed new approximate methods to account for the sub-grid scale variability of clouds on the radiative transfer. This approximate method is based on a first order closure technique. Exploiting the translational invariance of the equation of transfer leads to a one-dimensional, plane-parallel-like equation with a modified source term. This approach results in computational speeds exceeding that of the independent pixel approximation and improved accuracy over the latter as determined by numerical solutions of the two-dimensional transfer equation.

24513 (CONF-940277–, pp. 315-316) **Monte Carlo simulation of longwave fluxes through broken scattering cloud fields.** Takara, E.E. (Univ. of Maryland, College Park, MD (United States)); Ellingson, R.G. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The importance of cloud fields on the radiative energy budget is well known. For the sake of computational efficiency, cloud fields in general circulation models (GCMs) are approximated as flat black plates. This neglect of cloud geometry and transmissivity can lead to significant error in predicting radiative transfer. Increasing the sophistication of cloud models in GCMs has become a priority. Proper modeling of clouds requires that both their geometry and optical properties be taken into account. Modeling clouds as flat plates neglects the geometry. It has been well documented that the sides can have a significant effect. Scattering plays a significant role in the visible portion of the spectrum. The parameterized single scattering albedo for a cloud in the visible is above 0.99. As a result, most of the work on scatter in cloud fields has been done in the shortwave regime. The parameterized cloud single scattering albedos in the long wave ranges from 0.5 to 0.75.

24514 (CONF-940277–, pp. 317-323) **Use of cloud and radiation testbed measurements to evaluate cloud cover and convective parameterizations.** Walcek, C.J. (State Univ. of New York, Albany, NY (United States)); Hu, Q. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

We have used temperature and humidity soundings and radiation measurements from the Atmospheric Radiation Measurement (ARM) Cloud and Radiation Testbed (CART) site in northern Oklahoma to evaluate an improved cloud cover algorithm. We have also used a new single-column model cumulus parameterization to estimate convective heating and moistening tendencies at the CART site. Our earlier analysis of cloud cover showed that relatively dry atmospheres contain small cloud amounts. We have found numerous periods during 1993 where maximum relative humidities within any layer of the atmosphere over the CART site are well below 60-80%, yet clouds are clearly reducing shortwave irradiance measured by a rotating shadowband radiometer. These ARM measurements support our earlier findings that most current climate models probably underestimate cloud coverage when relative humidities fall below the threshold humidities where clear skies are assumed. We have applied a "detraining-plume" model of cumulus convection to the June 1993 intensive observation period (16-25 June 1993). This model was previously verified with GARP Atlantic Tropical Experiment (GATE) measurements. During the June intensive observing period (IOP), relative humidities over the CART site are typically 20% less than tropical Atlantic GATE relative humidities. Our convective model calculates that evaporation of convectively induced cloud and rainwater plays a much more important role in the heating and moistening convective tendencies at the drier CART location. In particular, we predict that considerable cooling and moistening in the lower troposphere should occur due to the evaporation of convectively initiated precipitation.

24515 (CONF-940277–, pp. 325-331) **Treatment of cloud radiative effects in general circulation models.** Wang, W.C. (State Univ. of New York, Albany, NY (United States)); Dudek, M.P.; Liang, X.Z.; Ding, M.; Zhu, L.; Joseph, E.; Cox, S. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

We participate in the Atmospheric Radiation Measurement (ARM) Program with two objectives: (1) to improve the general circulation model (GCM) cloud/radiation treatment with focus on cloud overlapping and the cloud optical properties; and (2) to study the effects of cloud/radiation-climate interaction on climate simulations. This report summarizes project progress from March 1993 to March 1994. During this period, four graduate students continue to participate in the research.

24516 (CONF-940277–, pp. 333-335) **Preliminary analysis of ground-based microwave and infrared radiance observations during the Pilot Radiation OBservation Experiment.** Westwater, E.R. (National Oceanic and Atmospheric Administration, Boulder, CO (United States)); Han, Y.; Churnside, J.H.; Snider, J.B. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation

measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

During Phase Two of the Pilot Radiation OBservation Experiment (PROBE) held in Kavieng, Papua New Guinea, the National Oceanic and Atmospheric Administration's Environmental Technology Laboratory (ETL) operated both microwave and infrared radiometers. Phase Two lasted from January 6 to February 28, 1993. The dramatic differences in the water vapor environment between the tropics and mid-latitudes were illustrated by Westwater et al. (1994) who presented PROBE data as well as additional data that were taken during the 1991 First ISCCP Regional Experiment (FIRE) 11 experiment in Coffeyville, Kansas. We present an analysis of microwave data and a preliminary analysis of infrared data obtained during PROBE.

24517 (CONF-940277–, pp. 337-340) **Ship-based measurements of cloud optical properties during the Atlantic Stratocumulus Transition Experiment.** White, A.B. (Univ. of Colorado, Boulder, CO (United States)); Fairall, C.W. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The Atlantic Stratocumulus Transition Experiment (ASTEX), conducted in June 1992, was designed with the broad goal of improving the dynamical, radiative, and microphysical models of marine boundary layer (MBL) clouds. This goal was pursued by combining measurements from a number of different platforms including aircraft, satellites, ships, and islands. In this paper, we examine the optical properties of MBL clouds using measurements taken on the NOAA research vessel Malcom Baldridge. We seek the relationship between optical depth and liquid water because this relationship is used to parameterize the optical properties of clouds in many global climate models (GCMs). We compare our results with the results obtained from two other marine cloud studies.

24518 (CONF-940277–, pp. 341-345) **Climate zones for maritime clouds.** White, A.B. (Univ. of Colorado, Boulder, CO (United States)); Ruffieux, D.; Fairall, C.W. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

In this paper we use a commercially available lidar ceilometer to investigate how the basic structure of marine boundary-layer clouds varies for four different marine climate regimes. We obtained most of the data used in this analysis from ship-based ceilometer measurements recorded during several different atmospheric and oceanographic field programs conducted in the Atlantic and Pacific oceans. For comparison, we show the results obtained at a mid-latitude continental location and at an ice camp on the Arctic ice shelf. For each analyzed case, we use an extended time series to generate meaningful cloud base and cloud fraction statistics. The Vaisala CT 12K ceilometer uses a GaAs diode laser to produce short (150 ns), high-intensity pulses of infrared radiation (904 nm wavelength). The return signals from a large number of consecutive pulses are coherently summed to boost the signal-to-noise ratio. Each resulting 30-s profile of backscattered power (15-m resolution) is analyzed to detect cloud layers using a specified cloud detection limit. In addition to measurements of cloud base, the ceilometer can also provide information on cloud fraction using a time series of the "cloud" or " no cloud" status reported in the 30-s data.

24519 (CONF-940277–, pp. 347-349) **Radiometric sounding system.** Whiteman, C.D. (Pacific Northwest Lab., Richland, WA (United States)); Anderson, G.A.; Alzheimer, J.M.; Shaw, W.J. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. DOE Contract AC06-76RL01830. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Vertical profiles of solar and terrestrial radiative fluxes are key research needs for global climate change research. These fluxes are expected to change as radiatively active trace gases are emitted to the earth's atmosphere as a consequence of energy production and industrial and other human activities. Models suggest that changes in the concentration of such gases will lead to radiative flux divergences that will produce global warming of the earth's atmosphere. Direct measurements of the vertical variation of solar and terrestrial radiative fluxes that lead to these flux divergences have been largely unavailable because of the expense of making such measurements from airplanes. These measurements are needed to improve existing atmospheric radiative transfer models, especially under the cloudy conditions where the models have not been adequately tested. A tethered-balloon-borne Radiometric Sounding System has been developed at Pacific Northwest Laboratory to provide an inexpensive means of making routine vertical soundings of radiative fluxes in the earth's atmospheric boundary layer to altitudes up to 1500 m above ground level. Such vertical soundings would supplement measurements being made from aircraft and towers. The key technical challenge in the design of the Radiometric Sounding System is to develop a means of keeping the radiometers horizontal while the balloon ascends and descends in a turbulent atmospheric environment. This problem has been addressed by stabilizing a triangular radiometer-carrying platform that is carried on the tetherline of a balloon sounding system. The platform, carried 30 m or more below the balloon to reduce the balloon's effect on the radiometric measurements, is leveled by two automatic control loops that activate motors, gears and pulleys when the platform is off-level. The sensitivity of the automatic control loops to oscillatory motions of various frequencies and amplitudes can be adjusted using filters.

24520 (CONF-940277–, pp. 351) **Use of a cloud ensemble model to develop cloudiness parameterizations.** Xu, K.M. (Colorado State Univ., Ft. Collins, CO (United States)); Randall, D.A. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to use a cloud ensemble model (CEM) as a tool for developing a cloudiness parameterization for use in climate models. CEM is a cloud-resolving model that is able to simulate an ensemble of clouds under given large-scale conditions. It can also provide detailed, statistical properties of clouds, information that cannot be obtained from observations. Several simulations have been performed with (1) typically observed large-scale conditions (e.g., large-scale advective cooling and moistening rates and large-scale pressure gradient forces) in the tropics; and (2) during the Atlantic Stratocumulus Transition EXperiment (ASTEX), using the University of California at Los Angeles CEM. Xu and Randall (1994) provide details of the simulations of tropical cloud clusters. The results from the ASTEX simulation are very preliminary. The main finding is that the amounts of stratiform cloud are highly correlated with cloud water+ice mixing ratio in both cloud regimes. The stratiform cloud amounts are somewhat correlated with the relative humidity (RH), too. The relationship between stratiform cloud amount and cloud water+ice mixing ratio does not depend upon the grid size of climate models. The scatter around the regression line is, however, slightly larger for smaller grid size. The large variation of relative humidity in smaller grid sizes is responsible for the scatter. Thus, a more accurate estimate of stratiform cloud amount must also include its dependency on RH.

24521 (CONF-940277–, pp. 353-355) **Single-column model for atmospheric radiation measurement sites: Model development and sensitivity test.** Xu, Q. (Univ. of Oklahoma, Norman, OK (United States)); Dong, M. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr

1995. Contract NA90-RAH00078; Contract 144880-A-Q1. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

A single-column model (SCM) is constructed by extracting the physical subroutines from the community climate model (CCMI) of the National Center for Atmospheric Research. Using observational data obtained from the Oklahoma Atmospheric Radiation Measurement (ARM) site and the National Weather Services, this SCM will perform diagnostic studies of radiation and cloud parameterizations. So far, the model has been tested with simulated data generated by CCM1 global runs. The global runs provide the SCM with initial and lateral boundary conditions that represent the Oklahoma ARM site. The preliminary results can be summarized as follows: the SCM can produce nearly the same results as the CCM1 if the lateral boundary conditions are precisely given from the spectral forms of representation of boundary fluxes; the SCM results are moderately sensitive to noise in the lateral boundary conditions. The SCM simulated temperature can (or cannot) closely follow the CCM1 global run if the noise in the lateral boundary fluxes is below (or above) 10% of the single level. The representativeness of the lateral boundary conditions seems crucial for the SCM simulations. When the advection term is calculated by using the central finite difference scheme from the gridded (instead of spectral) data produced by the CCM1 run, the SCM simulated temperature can differ significantly from that of the CCM1 global run.

24522 (CONF-940277–, pp. 357-360) **The impacts of data error and model resolution on the result of variational data assimilation.** Yang, S. (Univ. of Oklahoma, Norman, OK (United States)); Xu, Q. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. Contract NA90-RAH00078; Contract 144880-A-Q1. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The representativeness and accuracy of the measurements or estimates of the lateral boundary fluxes and surface fluxes are crucial for the single-column model and budget studies of climatic variables over Atmospheric Radiation Measurement (ARM) sites. Since the direct measurements of these fluxes have limited resolution, it is desirable to use high-resolution Doppler-radar data to retrieve the three-dimensional wind and temperature fields and improve the representativeness and accuracy of the estimated fluxes. To this end, a number of techniques of variational data assimilation (VDA) are currently being developed. This paper is intended to address the following specific issues: How is the retrieval error affected by the observational error? Could the observational error cause a bias in the retrieval? Does the retrieval error depend on the model grid resolution and how?

24523 (CONF-940277–, pp. 361-365) **Comparison between general circulation model simulation and central equatorial Pacific experiment measurements.** Zhang, G.J. (Univ. of California, San Diego, La Jolla, CA (United States)); Sherwood, S.; Barnett, T.P.; Ramanathan, V. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

A general circulation model (GCM) is a very powerful tool for understanding many climate issues. However, it must be validated using observational data in order for the model results to be credible in climate prediction. Data from the Atmospheric Radiation Measurement (ARM) Program will provide a valuable avenue for model validation. Effective use of GCMs can help to understand many important issues, such as the interaction between convection, boundary properties and surface radiative, and sensible and latent heat fluxes. To demonstrate the use of observed data for GCM validation, we compare the GCM simulation of the atmospheric fields with those from the field measurements during the Central Equatorial Pacific EXperiment (CEPEX). The CEPEX field mission was conducted from March 7 to April 6, 1993. Details of the experiment can be found in CEPEX Experiment Design (1993) and the CEPEX Operations Summary (1993). The measurements used in this study were mainly from the R/V Vickers, which cruised during the CEPEX period from about 160E to about 160W along 2S. Fifty-four soundings (including both Vaisala sondes and frostpoint hygrometer sondes) were launched during the course of the cruise. Surface data from the Tropical Ocean Global Atmosphere (TOGA) Tropical Atmosphere-Ocean (TAO) moored buoys are also used for comparison. The GCM used for this study is from the Max-Planck Institute and the University of Hamburg, Germany (ECHAM3). The simulation for the CEPEX period starts December 1, 1992. The lower boundary condition is from the interpolation of the monthly mean observed sea surface temperature (SST). The results averaged over the month from March 7 to April 6, 1993, are used for comparison with the field measurements.

24524 (CONF-940277–, pp. 367-370) **Sensitivity analysis with adjoint of radiation code.** Zivkovic, M. (Atmospheric and Environmental Research, Inc., Cambridge, MA (United States)); Louis, J.F. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The Atmospheric and Environmental Research (AER) Local Forecast and Assimilation (ALFA) model has been coupled with the NASA/Ames rapid model for radiation calculations. To provide a data assimilation system for the Atmospheric Radiation Measurement (ARM) Program, the adjoint codes of both models have been written. In addition to the data assimilation application, the adjoint can be used for sensitivity analysis applications. This paper reviews some results of a sensitivity analysis of radiative parameters in the spectral domain and within the context of a general circulation model (GCM). The adjoint equations allow a direct computation of the sensitivities of a model output to all meteorological and radiation parameters, with a single integration of the nonlinear model and the adjoint model. For example, if one is interested in knowing how sensitive the surface temperature is to the radiation parameters compared with other meteorological parameters, the response function needs to be set to surface temperature. At the end of the adjoint integration, the values of the adjoint variables corresponding to those parameters provide the requested sensitivities. Furthermore, if we know the uncertainties associated with these parameters, the accuracy of the model can be assessed. An example of such a computation is presented.

24525 (CONF-940277–, pp. 371-381) **Brightness fields of broken clouds.** Zuev, V.E. (Institute of Atmospheric Optics, Tomsk (Russian Federation)); Titov, G.A.; Kasyanov, E.I.; Zimin, D.A. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The radiation budget and brightness field of the system "atmosphere-underlying surface" are controlled, to a considerable degree, by the variety of forms and the strong space-time variability of cloud cover. The space and angle structure of the radiation fields of cloudy atmosphere together with their sensitivity to cloud variations provide an important source of information needed to formulate and solve problems of the remote optical sensing of cloudy atmosphere and of satellite meteorology, as well as for retrievals of the albedo from satellite measurements. Recent theoretical studies are largely based on the solution of the equation of radiative transfer in a plane-parallel, horizontally homogeneous cloud layer partially or completely covering the sky. However, such a simple model overlooks significant effects associated with the random geometry of the cloud field and, in fact, the important role it plays in

the formation of the radiation budget and brightness fields of the cloudy atmosphere. The presence of the above limitations, as well as a variety of related unsolved problems, for instance, with the interpretation of satellite data, has recently stimulated the development of the radiative transfer theory in stochastic scattering media.

24526 (CONF-940277–, pp. 383-385) **Mean fluxes of the near-infrared radiation in broken clouds.** Zuev, V.E. (Institute of Atmospheric Optics, Tomsk (Russian Federation)); Titov, G.A.; Zhuravleva, T.B.; Popov, S.Y. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Radiation codes of current general circulation models (GCMs) involve calculations of the spectrally integrated upward and downward fluxes of solar and thermal radiation at different atmospheric levels. For the visible, vertical profiles of the mean fluxes of upward and downward radiation in cumulus are studied by others. The aim of this study is to investigate the vertical profiles of the mean spectral fluxes of infrared (IR) solar radiation and the absorption in the field of cumulus clouds. The model of the atmosphere and methods for calculating the mean spectral fluxes in the near-IR spectral range are discussed in detail.

24527 (CONF-940277–, pp. 387-393) **Mean fluxes of visible solar radiation in broken clouds.** Zuev, V.E. (Institute of Atmospheric Optics, Tomsk (Russian Federation)); Titov, G.A.; Zhuravleva, T.B.; Popov, S.Y. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Generally, radiation codes for general circulation models (GCMs) include, together with other procedures, calculations of vertical profiles of upward and downward radiation fluxes which are needed to calculate radiant heat influxes. These last radiative characteristics serve as an input for a number of atmospheric processes predicted from GCMs, e.g., the equation of radiant heat influxes is sometimes a starting point for modeling the formation and evolution of cloud fields; the equation of heat balance of the earth's surface involves solar and thermal radiation fluxes that govern the surface thermal regime; and so forth. The question of the accuracy of determinations of the upward and downward radiation fluxes at different atmospheric levels is important. Most of the present GCM codes make use of the models of plane-parallel, horizontally homogeneous atmosphere and are based computationally on solving the equation of radiative transfer using deterministic optical characteristics. In the presence of clouds partially covering the sky, flux values represent a linear combination of clear- and overcast-sky fluxes weighted by a specific value of cloud fraction. Such an approach is adequate for the stratus-clouds-only cases, when the parameter $\gamma \approx 0$ (with $\gamma = H/D$, H the cloud layer thickness, and D the mean horizontal cloud size). Under the cumulus cloud conditions ($\gamma \approx 1$), the approach can be regarded merely as a first, fairly crude approximation, recognizing that the shortwave radiative transfer is affected remarkably by the stochastic geometry of cloud fields. Mean albedo and transmission of shortwave radiation in the system "clouds-aerosol-underlying surface" are sufficiently investigated. In the present work, we raise the question about the value of the effect the cloud field random geometry has on the mean upward and downward fluxes of the visible and near-IR solar radiation throughout the atmosphere.

24528 (CONF-950226–46) **Real-time chemical analysis of aerosol particles.** Yang, M.; Whitten, W.B.; Ramsey, J.M. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine; San Jose, CA (United States); 5-14 Feb 1995. Order Number DE95008971. Source: OSTI; NTIS; GPO Dep.

An important aspect of environmental atmospheric monitoring requires the characterization of airborne microparticles and aerosols. Unfortunately, traditional sample collection and handling techniques are prone to contamination and interference effects that can render an analysis invalid. These problems can be avoided by using real-time atmospheric sampling techniques followed by immediate mass spectrometric analysis. The former is achieved in these experiments via a two state differential pumping scheme that is attached directly to a commercially available quadruple ion trap mass spectrometer. Particles produced by an external particle generator enter the apparatus and immediately pass through two cw laser/fiberoptic based detectors positioned two centimeters apart. Timing electronics measure the time between detection events, estimate the particles arrival in the center of the ion trap and control the firing of a YAG laser. Ions produced when the UV laser light ablates the particle's surface are stored by the ion trap for mass analysis. Ion trap mass spectrometers have several advantages over conventional time-of-flight instruments. First, they are capable of MS/MS analysis by the collisional dissociation of a stored species, This permits complete chemical characterization of airborne samples. Second, ion traps are small and lend themselves to portable, field oriented applications.

24529 (CONF-9506191–2) **Cloud cover and type over the former USSR, 1936-83; trends derived from the RIHMI-WDC 223-station 6- and 3-hourly meteorological database.** Kaiser, D.P. (Oak Ridge National Lab., TN (United States)); Razuvaev, V.N. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. international meeting on statistical climatology; Galway (Ireland); Jun 1995. Order Number DE95014285. Source: OSTI; NTIS; GPO Dep.

This paper presents trends analyses of sky cover data from the former U.S.S.R. for the period 1936-83. Observations of total cloud amount, low cloud amount, and low-, middle-, and high-cloud type from 223 stations were obtained from a database of 6- and 3-hourly meteorological observations compiled at the Research Institute of Hydrometeorological Information - World Data Centre in Obninsk, Russia. Station data were averaged over various-sized grid boxes and linear trends in seasonal mean total cloud amount, low cloud amount, frequency of occurrence of cirrus clouds, cirrus amount, and frequency of clear sky were computed for the period 1936-83.

24530 (DLR-FB–94-18) **The squall line of 21 July 1992 in Switzerland and southern Germany - a documentation.** Haase-Straub, S.P. (ed.) (Muenchen Univ. (Germany). Meteorologisches Inst.); Heimann, D. (ed.); Hauf, T. (ed.); Smith, R.K. (ed.). Deutsche Forschungsanstalt fuer Luft- und Raumfahrt e.V. (DLR), Wessling (Germany). Forschungsbereich Nachrichtentechnik und Erkundung; Deutsche Forschungsanstalt fuer Luft- und Raumfahrt e.V. (DLR), Koeln (Germany). Abt. Operative Planung. Jul 1994. 236p. Order Number DE95791278. Source: OSTI; NTIS (US Sales Only).

This volume contains scientific contributions of German and Swiss colleagues who were engaged in the case study of 21 July 1992 within the scope of the CLEOPATRA field experiment. The contributions document the meteorological situation that brought about severe storms on this day. (orig.)

24531 (DOE/ER–0650T) **Atmospheric Science Program. Summaries of research in FY 1994.** USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Jun 1995. 71p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014935. Source: OSTI; NTIS; GPO Dep.

This report provides descriptions for all projects funded by ESD under annual contracts in FY 1994. Each description contains the project's title; three-year funding history (in thousands of dollars); the contract period over which the funding applies; the name(s) of the principal investigator(s); the institution(s) conducting the projects; and the project's objectives, products, approach, and results to date (for most projects older than one year). Project descriptions are categorized within the report according to program areas: atmospheric chemistry, atmospheric dynamics, and support operations. Within these categories, the descriptions are ordered alphabetically by principal investigator. Each program area is preceded by a brief text that defines the program area, states it goals and objectives,

lists principal research questions, and identifies program managers. Appendixes provide the addresses and telephone numbers of the principal investigators and define the acronyms used.

24532 (DOE/ER/60397–7) **Detection of greenhouse-gas-induced climatic change. Progress report, July 1, 1994–July 31, 1995.** Jones, P.D.; Wigley, T.M.L. East Anglia Univ., Norwich (United Kingdom). Climatic Research Unit. 21 Jul 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER60397. Order Number DE95015922. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to assembly and analyze instrumental climate data and to develop and apply climate models as a basis for detecting greenhouse-gas-induced climatic change, and validation of General Circulation Models. In addition to changes due to variations in anthropogenic forcing, including greenhouse gas and aerosol concentration changes, the global climate system exhibits a high degree of internally-generated and externally-forced natural variability. To detect the anthropogenic effect, its signal must be isolated from the "noise" of this natural climatic variability. A high quality, spatially extensive data base is required to define the noise and its spatial characteristics. To facilitate this, available land and marine data bases will be updated and expanded. The data will be analyzed to determine the potential effects on climate of greenhouse gas and aerosol concentration changes and other factors. Analyses will be guided by a variety of models, from simple energy balance climate models to coupled atmosphere ocean General Circulation Models. These analyses are oriented towards obtaining early evidence of anthropogenic climatic change that would lead either to confirmation, rejection or modification of model projections, and towards the statistical validation of General Circulation Model control runs and perturbation experiments.

24533 (ENEA-RT-AMB–93-12) **Evaluation of aerosol particulate measurements based on membrane filters analysis.** Formignani, M. (ENEA, Bologna (Italy). Area Energia Ambiente e Salute); Castellani, C.M.; Tarroni, G. ENEA, Bologna (Italy). Area Energia Ambiente e Salute. Apr 1993. 37p. (In Italian). Order Number DE95789710. Source: OSTI; NTIS (US Sales Only).

The present report summarizes a study on evaluation of the uncertainty concerned with the measurement of the mass airborne concentration performed with aerosol particulate sampling on the membrane filters usually employed for environmental samplings. Some problems are focused concerning the sample weighing procedure, such as the electrostatic charge as well as the relative humidity on the filters. A weighing methodology is presented allowing for the minimization as well as quantitative evaluation of the errors connected with the measurements, avoiding the introduction of complicated and expensive systems for the conditioning of the weighing environment. Three atmospheric particulate concentration samplings have been carried out in a month using 5 sampling equipments at a time, detecting different environmental concentration versus different atmospheric conditions. This technique allowed evaluation of the variability of the aerosol mass concentration as well as determination of the minimum detectable quantities versus the air sampled volume. Finally a menu synthesis has been implemented for the weighing procedure to be applied to the membrane filters so that it guarantees the routine accuracy requirements to be fulfilled.

24534 (ENEA-RT-AMB–94-21) **Evolution of atmospheric pollution networks in Italy.** Bruni, S. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute). ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Sep 1994. 104p. (In Italian). Order Number DE95789770. Source: OSTI; NTIS (US Sales Only).

The scope of this report is to give an overview on the evolution of the atmospheric pollution networks (related to measured air quality data) in Italy; the analysis covers the year 1986 up to the beginning of 1991.

24535 (ETDE-DE–145) **The reduction of complex dynamical systems using principal interaction patterns.** Report - Max-Planck-Institut fuer Meteorologie, v. 161. Kwasniok, F. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). 5 May 1995. 48p. Order Number DE95790288. Source: OSTI; NTIS (US Sales Only).

A method of constructing low-dimensional nonlinear models capturing the main features of complex dynamical systems with many degrees of freedom is described. The system is projected onto a linear subspace spanned by only a few characteristic spatial structures called Principal Interaction Patterns (PIPs). The expansion coefficients are assumed to be governed by a nonlinear dynamical system. The optimal low-dimensional model is determined by identifying spatial modes and interaction coefficients describing their time evolution simultaneously according to a nonlinear variational principle. The algorithm is applied to a two-dimensional geophysical fluid system on the sphere. The models based on Principal Interaction Patterns are compared to models using Empirical Orthogonal Functions (EOFs) as basis functions. A PIP-model using 12 patterns is capable of capturing the long-term behaviour of the complete system monitored by second-order statistics, while in the case of EOFs 17 modes are necessary. (orig.)

24536 (ETDE-DE–159) **Stratospheric climate and variability from a general circulation model and observations. Pt. 2. Results for March-May, June-August and September-November.** Report - Max-Planck-Institut fuer Meteorologie, v. 164. Manzini, E.; Bengtsson, L. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). May 1995. 38p. Order Number DE95790221. Source: OSTI; NTIS (US Sales Only).

This report is the second part of a work aimed at studying the climate and variability of the large scale stratospheric circulation by comparing atmospheric statistics from a simulation performed with a general circulation model and from global analyzed observations. Part I (Manzini and Bengtsson, 1994) focused on December-February, while here the remaining part of the seasonal cycle is discussed. The March-May climatological seasonal mean zonal mean circulation is found to be reasonably well simulated. In the Northern hemisphere stratosphere, very weak westerly winds and high interannual variability characterize both the observed and model data, suggesting that the final stratospheric warming in the Northern hemisphere occurs in a realistic way in the model. The simulation of the zonal mean circulation during the June-August is relatively successful, although a winter cold bias of moderate amplitude and vertical extent is found. In comparison with the boreal winter, the interannual variability of the austral winter is smaller at high latitudes, in the simulation as well as in the observed state. Although the structure of the observed variability is captured by the model, its magnitude is underestimated, especially in August. Significant discrepancies between the model results and the analyzed observations are found during the final vortex breakdown (September-November) in the Southern hemisphere, apparently caused by insufficient large scale orographic forcing from the Antarctic continent in the current low resolution model. (orig.)

24537 (ETDE-DE–160) **The role of water vapor and convection during the Central Equatorial Pacific Experiment (CEPEX) from observations and model simulations.** Report - Max-Planck-Institut fuer Meteorologie, v. 159. Lohmann, U. (Max-Planck-Institut fuer Meteorologie, Hamburg (Germany)); Roeckner, E.; Collins, W.D.; Heymsfield, A.J.; McFarquhar, G.; Barnett, T.P. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Mar 1995. 41p. Order Number DE95790908. Source: OSTI; NTIS (US Sales Only).

Observed data from field measurements taken during the Central Equatorial Pacific EXperiment (CEPEX) conducted from March 7 to April 5, 1993 are used to study the link between water vapor, convection and SST in comparison with results from a general circulation model (GCM). Three high resolution simulations were carried out with slightly different initial conditions using ECMWF (European Centre for Medium Range Weather Forecasts) analyses from March 1, 1993 and forced with the observed sea surface temperature (SST) as lower boundary condition. Radiosondes released between the equator and 5 S show a dry region east of the dateline collocated with a clear sky region observed from the GMS satellite in the first two weeks of CEPEX, which both vanish in the second two weeks. The model is able to reproduce this change in convective activity. Moreover, a comparison of relative humidity profiles grouped according to SST and infrared brightness temperature (IRBT) indicate that the GCM altogether captures the observed behavior. The atmosphere is relatively moist when the SST is warm and low IRBTs occur at the same time, i.e. when convection

takes place, and dryer than on average for the opposite case. In general, however, the model is too dry in the mid-troposphere and too wet in the upper troposphere. Very good agreement is found between the simulated and observed ice water content, in particular with respect to its increase with temperature. (orig.)

24538 (ETDE-DE–161) **The 19th century discussion of climate variabilility and climate change: analogies for the present debate.** Report - Max-Planck-Institut fuer Meteorologie, v. 157. Stehr, N. (Alberta Univ., Edmonton, AB (Canada). Dept. of Sociology); Storch, H. von; Fluegel, M. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). 14 Feb 1995. 30p. Order Number DE95790970. Source: OSTI; NTIS (US Sales Only).

Toward the end of the nineteenth and at the beginning of twentieth century significant discussions occurred among geographers, meteorologists and "climatologists" concerned with the notion of climate variability (Klimaschwankungen) and anthropogenic climate change (Klimawandel/Klimaaenderungen), for instance, due to deforestation and reforestation. We identifiy two protagonists of this debate, Eduard Brueckner and Julius Hann, who both accept the notion of climate variability on the decadal scale, but respond in very different ways to the discovery of climate change. Brueckener assessed the impact of climate variability on society (e.g., on health, the balance of trade, emigration to the USA), and tried to bring these to the attention of the public, whereas Hann limited himself to the immediate natural scientific problem of monitoring and documenting climate variability. We suggest that these discussions and the formation of national governmental and parliamentary committees almost 100 years ago, are not merely of historical interest. In view of the present discussion of climate variablity and anthropogenic climate change, and the need for adquate socio-economic response strategies, past and now neglected arguments may prove important for methodoligical and theoretical as well as for practical reasons. The past discussions represent a significant social and intellectual analogy for the present situation. (orig.)

24539 (ETDE-DE–172) **Tropical intraseasonal oscillation appearing in operational analyses and in a family of general circulation models.** Report - Max-Planck-Institut fuer Meteorologie, v. 165. Gualdi, S. (Max-Planck-Institut fuer Meteorologie, Hamburg (Germany)); Storch, H. von; Navarra, A. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). May 1995. 49p. Order Number DE95795715. Source: OSTI; NTIS (US Sales Only).

The statistics of the tropical intraseasonal variability (MJO) is analyzed in the ECMWF analyses and in several ECHAM GCM experiments, which have been performed with different model versions (ECHAM2 and ECHAM3), horizontal resolutions (T21, T42 and T106), and with and without annual cycle. The analysis technique is the Principal Oscillation Pattern (POP) analysis, applied to the 200 mb equatorial velocity potential. The intercomparison of ECHAM2 experiments with and without annual cycle shows that much more realistic results are obtained when the annual cycle is included in the simulation. At low resolution (T21), the improved model physics has a beneficial impact on the simulated MJO. The oscillation is more successfully reproduced in the more recent model version (ECHAM3). An increase of the horizontal resolution, in this latter case, leads to less favorable results. (orig.)

24540 (ETDE-DE–173) **The water vapour continuum and its representation in ECHAM4.** Report - Max-Planck-Institut fuer Meteorologie, v. 162. Giorgetta, M. (Max-Planck-Institut fuer Meteorologie, Hamburg (Germany)); Wild, M. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). May 1995. 47p. Order Number DE95795758. Source: OSTI; NTIS (US Sales Only).

The analysis of the longwave radiation scheme revealed the special role of water vapour among the IR-absorbing and emitting gases in the atmosphere. This is obvious by the fact that water vapour absorption is computed in two terms, i.e. the line term and the continuum term, while absorption rates for all other gases need only the line term. Curiosity for the reason of this distinction lead to the study of the corresponding literature and showed finally a way to improve the performance of the water vapour absorption within this model. The subsequently presented modifications increase the longwave downward fluxes at the surface in cold and/or dry places and help to bring model results in correspondence with observations. The following chapters lead from general properties of gaseous absorption to spectral properties of water vapour, water vapour absorption in the atmospheric window region, the definition of the continuum, and to the hypothetical explanations of the continuum. The succeeding chapters cover the continuum parameterization in ECHAM4, the applied modifications, the validation and finally an estimation of the impact on the ECHAM4 climate. (orig./HM)

24541 (FZKA–5524) **Off gas cleaning by electron beam. The mobile test facilty AGATE-M.** Albrecht, G.; Baumann, W.; Paur, H.R. Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Inst. fuer Technische Chemie. Feb 1995. 34p. (In German). Order Number DE95790228. Source: OSTI; NTIS (US Sales Only).

Industrial off gases, containing pollutants (Volatile Organic Compounds, NO_x) may be cleaned by irradiation with accelerated electrons. Laboratory tests show, that this process is especially suitable for low concentrated off gases because of high removal efficiencies at low energy consumption. In addition it must be noted, that the process is insensitive towards particulates and may be easily adjusted to different load conditions. The goals of this project are the test and the demonstration of the process in an industrial environment. The mobile test facility AGATE-M was constructed in cooperation between the Forschungszentrum Karlsruhe and the Institute for Surface Modification (IOM). As first projects we plan to use the mobile plant for cleaning the waste gases from paint production plant, from a remediation plant emitting chlorinated hydrocarbons (CHC) and from an automobil tunnel. The plant and the electron accelerator are controlled by programmable computer units. The relevant operation data are being measured by suitable instruments and saved by an electronic data logger. The gas compositions at the plants inlet and outlet are measured by flame ionization detector (FID) and by gas chromatography (GC). Additional analyzers are employed according to demand. (orig./SR)

24542 (FZKA–5529) **Depth resolving analysis of outdoor aerosol particles with secondary mass spectrometry.** Schuricht, J. Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Inst. fuer Radiochemie; Karlsruhe Univ. (T.H.) (Germany). Fakultaet fuer Chemie. Mar 1995. 121p. (In German). Order Number DE95795765. Source: OSTI; NTIS (US Sales Only).

Atmospheric aerosol particles are of significant influence to the chemistry of the atmosphere. Emission processes and the interaction with the environment often cause a depth distribution of the chemical compounds within the particles. Thus the analysis of the chemical composition of the particles as well as the analysis of their depth structure is of great importance. Moreover the reactivity of elements depend on the current compounds, so the analysis of aerosol particles should give also information on the depth distribution of compounds. These information can be obtained by mass analysis of sputter eroded material, i.e. secondary ion mass spectrometry (SIMS) and secondary neutral mass spectrometry (SNMS). Plasma-SNMS was used in this work for the quantitative determination of elemental concentrations and elemental depth profiles of atmospheric particles collected from outdoor air. (orig.)

24543 (ISTISAN–94-15) **Acid areosol: Formation, health effects, measurement methods.** Puledda, S. (Istituto Superiore di Sanita, Rome (Italy)). Istituto Superiore di Sanita, Rome (Italy). Sep 1994. 52p. (In Italian). Order Number DE95771028. Source: OSTI; NTIS (US Sales Only).

The formation of acidic aerosols in the atmosphere, linked to different types of industrial activities and to the use of fossile fuels, represents a serious environmental problem. At present, the United States Environmental Protection Agency is considering the possibility of including acidic aerosols in the group of the so-called 'criteria pollutants' for which specific limits are established. The European Union is following the same trend. This would have direct consequences on the Italian regulations. The present study discusses the formation, health effects and measurement methods for acidic aerosols, using data mostly related to the North American area, where the great majority of researches are carried out.

24544 (JAERI-Research–94-040) **Improvement of a three-dimensional atmospheric dynamic model and examination of its performance over complex terrain.** Nagai, Haruyasu (Japan

Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Yamazawa, Hiromi. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 46p. (In Japanese). Order Number DE95789462. Source: OSTI; NTIS; INIS.

A three-dimensional atmospheric dynamic model (PHYSIC) was improved and its performance was examined using the meteorological data observed at a coastal area with a complex terrain. To introduce synoptic meteorological conditions into the model, the initial and boundary conditions were improved. By this improvement, the model can predict the temporal change of wind field for more than 24 hours. Moreover, the model successfully simulates the land and sea breeze observed at Shimokita area in the summer of 1992. (author).

24545 (LA-SUB–95-98) **Desert Research Institute cloud droplet videometer measurements in support of MASTEX.** Los Alamos National Lab., NM (United States). 13 Feb 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015247. Source: OSTI; NTIS; GPO Dep.

In support of the Monterey Area Ship-Track Experiment (MASTEX) the Desert Research Institute completed modifications to an existing cloud droplet videometer and construction of a second unit for deployment on board the RV Glorita during the month of June 1994. Dr. Randolph Borys accompanied the instrumentation during the period the ship was at sea and assisted in the day-to-day experiments which were conducted on board. Unusually clear conditions and high winds contributed to the lack of opportunities to deploy the new instrument from the ship.

24546 (ORNL/TM–12861) **Environmental resources of selected areas of Hawaii: Climate, ambient air quality, and noise.** Lombardi, D.A. (Oak Ridge National Lab., TN (United States)); Blasing, T.J.; Easterly, C.E.; Reed, R.M.; Hamilton, C.B. Oak Ridge National Lab., TN (United States). Mar 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014068. Source: OSTI; NTIS; GPO Dep.

This report has been prepared to make available and archive background scientific data and related information on climate, ambient air quality, and ambient noise levels collected during the preparation of the environmental impact statement (EIS) for Phases 3 and 4 of the Hawaii Geothermal Project (HGP) as defined by the state of Hawaii in its April 1989 proposal to Congress. The US Department of Energy (DOE) published a notice withdrawing its Notice of Intent to prepare the HGP-EIS. Since the state of Hawaii is no longer pursuing or planning to pursue the HGP, DOE considers the project to be terminated. The report presents a general description of the climate add air quality for the islands of Hawaii (henceforth referred to as Hawaii), Maui and Oahu. It also presents a literature review as baseline information on the health effects of sulfide. The scientific background data and related information is being made available for use by others in conducting future scientific research in these areas. This report describes the environmental resources present in the areas studied (i.e., the affected environment) and does not represent an assessment of environmental impacts.

24547 (PNL–10500-Pt.2) **Pacific Northwest Laboratory annual report for 1994 to the DOE Office of Energy Research. Part 2: Atmospheric and climate research.** Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015264. Source: OSTI; NTIS; GPO Dep.

Atmospheric research at Pacific Northwest Laboratory (PNL) occurs in conjunction with the Atmospheric Chemistry Program (ACP) and with the Atmospheric Studies in Complex Terrain (ASCOT) Program. Solicitations for proposals and peer review were used to select research projects for funding in FY 1995. Nearly all ongoing projects were brought to a close in FY 1994. Therefore, the articles in this volume include a summary of the long-term accomplishments as well as the FY 1994 progress made on these projects. The following articles present summaries of the progress in FY 1994 under these research tasks: continental and oceanic fate of pollutants; research aircraft operations; ASCOT program management; coupling/decoupling of synoptic and valley circulations; interactions between surface exchange processes and atmospheric circulations; and direct simulations of atmospheric turbulence. Climate change research at PNL is aimed at reducing uncertainties in the fundamental processes that control climate systems that currently prevent accurate predictions of climate change and its effects. PNL is responsible for coordinating and integrating the field and laboratory measurement programs, modeling studies, and data analysis activities of the Atmospheric Radiation Measurements (ARM) program. In FY 1994, PNL scientists conducted 3 research projects under the ARM program. In the first project, the sensitivity of GCM grid-ad meteorological properties to subgrid-scale variations in surface fluxes and subgrid-scale circulation patterns is being tested in a single column model. In the second project, a new and computationally efficient scheme has been developed for parameterizing stratus cloud microphysics in general circulation models. In the last project, a balloon-borne instrument package is being developed for making research-quality measurements of radiative flux divergence profiles in the lowest 1,500 meters of the Earth's atmosphere.

24548 (PNL-SA–25632) **Prognostic atmospheric and dispersion modeling in the vicinity of Rocky Flats Plant.** Fast, J.D. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830 ; AC09-89SR18035. (CONF-950430–7: 5. ANS topical meeting on emergency preparedness and response, Savannah, GA (United States), 18-21 Apr 1995). Order Number DE95014193. Source: OSTI; NTIS; INIS; GPO Dep.

A multiscale four-dimensional data assimilation technique is incorporated into a mesoscale model and evaluated using meteorological and tracer data collected during the Atmospheric Studies in Complex Terrain (ASCOT) field experiment in the winter of 1991. The mesoscale model is used to predict the interaction of synoptically-driven flows and small-scale circulations influenced by terrain along the Front Range in Colorado in the vicinity of the Rocky Flats Plant for four nocturnal periods during the ASCOT field experiment. Data assimilation is used to create dynamically consistent analysis fields based on the mesoscale forecasts and the special asynoptic data taken during this experiment. The wind and turbulence quantities produced by the mesoscale model are then used to determine the dispersion of a tracer released from the Rocky Flats Plant for each evening. The mesoscale model is able to qualitatively predict the mesobeta-scale drainage flows from the Front Range into the South Platte River basin; however, the largest forecast errors occurred in a region immediately adjacent to the foothills. As expected, the current data assimilation technique reduced the overall errors in the atmospheric and dispersion calculations while the model generated realistic small-scale circulations not resolved by the data. Still, the model did not capture the shallow surface drainage flows just east of the Rocky Flats Plant for two of the evenings during the field experiment.

24549 (PNL-SA–25949) **Solar semidiurnal tidal wind oscillations above the CART site.** Whiteman, C.D.; Bian, X. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9503140–9: 5. atmospheric radiation measurement (ARM) meeting, San Diego, CA (United States), 20-23 Mar 1995). Order Number DE95014612. Source: OSTI; NTIS; GPO Dep.

Harmonic analysis of wintertime data from 915- and 404-MHz radar wind profilers at four sites in North America has identified coherent semidiurnal wind oscillations through the entire depth of the troposphere. These winds are readily apparent above the CART site, as evidenced from analyses of data from the Haviland, KS, radar profiler. The characteristics of this wind system match the characteristics of solar semidiurnal atmospheric tides, as predicted by a simple dynamic model.

24550 (RFP–4972) **Toxic chemical release inventory at the Rocky Flats Environmental Technology Site.** Leonard, R.J. (Kaiser-Hill Co., Golden, CO (United States)). EG and G Rocky Flats, Inc., Golden, CO (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90RF62349. (CONF-9506210–1: 10. annual Federal facilities conference, Denver, CO (United States), 29 Jun 1995). Order Number DE95014672. Source: OSTI; NTIS; GPO Dep.

The Rocky Flats Environmental Technology Site (Site) submits an annual Toxic Chemical Release Inventory (Form R) as required under the Emergency Planning and Community Right-to-Know Act (EPCRA). The Site uses a multi-step process for completing the Form R which includes developing a written procedure, determine thresholds, collection of chemical use and fate information, and peer review.

24551 (UCRL-JC-118633) **Development of the Emission Measurement and Information Tracking System (EMITS) for regulatory analysis.** McCormack, C.E.; Dorenkamp, L.D. Lawrence Livermore National Lab., CA (United States). Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941138-1: International specialty conference: the emission inventory - applications and improvements, Raleigh, NC (United States), 1-3 Nov 1994). Order Number DE95014512. Source: OSTI; NTIS; GPO Dep.

With the constant implementation of complex and restrictive state and federal clean air laws, a facility must have a comprehensive understanding of the types and amount of emissions associated with the facility's operations. Knowledge of the facility's emissions is essential to assess the operational impacts of current and upcoming legislation. Lawrence Livermore National Laboratory (LLNL), located in California, is regulated by federal, state, and local air quality agencies. Of most concern to the facility is California's Assembly Bill 2588 (also known as the "Air Toxics Hot Spots" program) and the federal Title III, Title V, and Title VI provisions of the Clean Air Act as amended in 1990. Because of the complex regulatory requirements, LLNL needed a system to calculate and classify air emissions by each applicable regulatory program. This paper outlines the development of LLNL's comprehensive emissions inventory known as the Emissions Measurement and Information Tracking System (EMITS).

24552 (UCRL-JC-120469) **Computational fluid dynamics modeling for emergency preparedness and response.** Lee, R.L.; Albritton, J.R.; Ermak, D.L.; Kim, J. Lawrence Livermore National Lab., CA (United States). Feb 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950927-4: International conference and workshop on modeling and mitigating the consequences of accidental releases of hazardous materials, New Orleans, LA (United States), 26-29 Sep 1995). Order Number DE95013432. Source: OSTI; NTIS; GPO Dep.

Computational fluid dynamics (CFD) has (CFD) has played an increasing in the improvement of atmospheric dispersion modeling. This is because many dispersion models are now driven by meteorological fields generated from CFD models or, in numerical weather prediction's terminology, prognostic models. Whereas most dispersion models typically involve one or a few scalar, uncoupled equations, the prognostic equations are a set of highly-couple equations whose solution requires a significant level of computational power. Recent advances in computer hardware and software have enabled modestly-priced, high performance, workstations to exhibit the equivalent computation power of some mainframes. Thus desktop-class machines that were limited to performing dispersion calculations driven by diagnostic wind fields may now be used to calculate complex flows using prognostic CFD models. The Release and Advisory Capability (ARAC) program at Lawrence Livermore National Laboratory (LLNL) has, for the past several years, taken advantage of the improvements in hardware technology to develop a national emergency response capability based on executing diagnostic models on workstations. Diagnostic models that provide wind fields are, in general, simple to implement, robust and require minimal time for execution. Because these models typically contain little physics beyond mass-conservation, their performance is extremely sensitive to the quantity and quality of input meteorological data and, in spite of their utility, can be applied with confidence to only modestly complex flows. We are now embarking on a development program to incorporate prognostic models to generate, in real-time, the meteorological fields for the dispersion models. In contrast to diagnostic models, prognostic models are physically-based and are capable of incorporating many physical processes to treat highly complex flow scenarios.

24553 (UCRL-JC-120645) **OH generation in steam-air pulsed corona.** Garcia, M.; Chang, B. Lawrence Livermore National Lab., CA (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950875-1: International symposium on plasma chemistry, Minneapolis, MN (United States), 21-25 Aug 1995). Order Number DE95013293. Source: OSTI; NTIS; GPO Dep.

The measurement of OH concentration in a pulsed corona discharge through a steam-air mixture is compared with a chemical kinetics model. The original motivation was to develop a technological hydroxilizer for oxidizing gas pollutants to acids. Time dependent measurements of the 3,064 Å emission of OH indicate a production of nearly 4 ppm within a spark. This measurement was accomplished by a 1 ns resolution photomultiplier with a 100 Å filter centered at 3080 Å. The discharge occurs across a 1 cm coaxial gap between a central anode tube and an outer cylindrical cathode cased in glass and at ground potential. The water-air mixture is of equal proportions and at 1 atmosphere. Pulsed voltage of 38 kV and 60 ns risetime produces a 60 A, 20 ns spark. The model predicts comparable OH production by dissociation in the air-water mixture after 100 ns of 10^{12} electrons/cm^3. The electron density is set to zero during the subsequent 100 μs in the model, and thereafter OH is seen as a short-lived reaction product of HO_2 with O and N atoms. The sequence of reaction is: 100 ns of dissociation to peak OH concentration, 0.2 μs for hydrogen atom loss and HO_2 formation, 20 μs for O atom loss and O_3 formation, beyond 20 μs NO formation from N atoms with OH and HO_2. In the model HO_2 ultimately decays by slowly forming H_2O_2, so it may be viewed as a stable fuel which produces OH when combined with atomic oxygen or nitrogen.

24554 (UCRL-JC-120927) **Climate signal and weather noise.** Leith, C.E. Lawrence Livermore National Lab., CA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506191-1: 6. international meeting on statistical climatology, Galway (Ireland), Jun 1995). Order Number DE95011752. Source: OSTI; NTIS; GPO Dep.

A signal of small climate change in either the real atmosphere or numerical simulation of it tends to be obscured by chaotic weather fluctuations. Time-lagged covariances of such weather processes are used to estimate the sampling errors of time average estimates of climate parameters. Climate sensitivity to changing external influences may also be estimated using the fluctuation dissipation relation of statistical mechanics. Answers to many climate questions could be provided by a realistic stochastic model of weather and climate.

24555 (UCRL-JC-121009) **Ensemble techniques for seasonal prediction.** Palmer, T.N. (and others); Buizza, R.; Brankovic, C. Lawrence Livermore National Lab., CA (United States). Apr 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504178-1: 1995 tropical and ocean global atmosphere (TOGA) conference, Melbourne (Australia), 2-7 Apr 1995). Order Number DE95014393. Source: OSTI; NTIS; GPO Dep.

The prediction of interannual climate fluctuations is discussed. The role that ensemble techniques can play is addressed.

24556 (WHC-SD-GN-SWD-30003-Rev.1) **GXQ program verification and validation. Revision 1.** Hey, B.E. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 156p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012581. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the program user's guide of a general purpose atmospheric dispersion code named GXQ. GXQ is an IBM Compatible microcomputer based program for calculating atmospheric dispersion coefficients using Hanford site specific joint frequency data. It uses the Gaussian straight line model to calculate either an atmospheric dispersion coefficient (X/Q') or a maximum normalized air concentration (X/Q). Several options are available to the user which alter the standard Gaussian model to allow for plume depletion, building wake, plume meander, sector averaging, gravitational settling and plume rise. Additional options

control handling of the joint frequency data and output. Combinations of the above allow calculation of X/Q' in accordance with Nuclear Regulatory Commission Regulatory Guide 1.145. The GXQ source code listing is provided in an appendix.

24557 (ANL/CMT/PP–80445) **A quantitative method to detect explosives and selected semivolatiles in soil samples by Fourier transform infrared spectroscopy.** Clapper-Gowdy, M. (Argonne National Lab., IL (United States)); Dermirgian, J.; Robitaille, G. Argonne National Lab., IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013551. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes a novel Fourier transform infrared (FTIR) spectroscopic method that can be used to rapidly screen soil samples from potentially hazardous waste sites. Samples are heated in a thermal desorption unit and the resultant vapors are collected and analyzed in a long-path gas cell mounted in a FTIR. Laboratory analysis of a soil sample by FTIR takes approximately 10 minutes. This method has been developed to identify and quantify microgram concentrations of explosives in soil samples and is directly applicable to the detection of selected volatile organics, semivolatile organics, and pesticides.

24558 (ANL/EA/CP–84325) **An accelerated remedial strategy developed for J-Field, Aberdeen Proving Ground, Maryland.** Yuen, C.R. (Argonne National Lab., IL (United States)); Martino, L.; Patton, T.; Wrobel, J. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950451–2: 21. national environmental symposium and exhibition, San Diego, CA (United States), 17-21 Apr 1995). Order Number DE95012926. Source: OSTI; NTIS; GPO Dep.

For an installation with many disposal sites and multiple contaminant sources, successful remediation at minimum cost can be complicated by insufficient geologic and hydrogeologic information, incomplete records of historical disposal activities, and uncertainty about the effectiveness of different investigative methods. To reduce these uncertainties and to increase the probability of successful remediation at minimum cost, a "Phased and pilot" accelerated remedial strategy has been developed for the J-Field area of Aberdeen Proving Ground, Maryland. The strategy includes four phases. First, the most contaminated site is selected as a pilot for detailed investigation. Second, the most contaminated areas within the pilot site are chosen as a pilot source area for interim action study, and a remedial action is developed to remove the primary contaminant sources. The subsequent sitewide investigation uses the effective tools developed in the first phase. Third, a cleanup operation is initiated in the pilot source area, while a sitewide feasibility study is developed by taking advantage of lessons learned in the interim action. Fourth, a sitewide cleanup operation proceeds.

24559 (ANL/EA/CP–85472) **A Bayesian/geostatistical approach to the design of adaptive sampling programs.** Johnson, R.L. (Argonne National Lab., IL (United States). Environmental Assessment Div.). Argonne National Lab., IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950159–2: Workshop and symposium on geostatistics for geotechnical and environmental applications, Phoenix, AZ (United States), 26-27 Jan 1995). Order Number DE95013500. Source: OSTI; NTIS; GPO Dep.

Traditional approaches to the delineation of subsurface contamination extent are costly and time consuming. Recent advances in field screening technologies present the possibility for adaptive sampling programs–programs that adapt or change to reflect sample results generated in the field. A coupled Bayesian/geostatistical methodology can be used to guide adaptive sampling programs. A Bayesian approach quantitatively combines "soft" information regarding contaminant location with "hard" sampling results. Soft information can include historical information, non-intrusive geophysical survey data, preliminary transport modeling results, past experience with similar sites, etc. Soft information is used to build an initial conceptual image of where contamination is likely to be. As samples are collected and analyzed, indicator kriging is used to update the initial conceptual image. New sampling locations are selected to minimize the uncertainty associated with contaminant extent. An example is provided that illustrates the methodology.

24560 (ANL/EA/CP–86344) **Land cover change and remote sensing: Examples of quantifying spatiotemporal dynamics in tropical forests.** Krummel, J.R. (Argonne National Lab., IL (United States)); Su, Haiping; Fox, J.; Yarnasan, S.; Ekasingh, M. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9503154–1: Remote sensing and environmental monitoring for the sustainable development of the Americas, San Juan (Puerto Rico), 21-22 Mar 1995). Order Number DE95012272. Source: OSTI; NTIS; GPO Dep.

Research on human impacts or natural processes that operate over broad geographic areas must explicitly address issues of scale and spatial heterogeneity. While the tropical forests of Southeast Asia and Mexico have been occupied and used to meet human needs for thousands of years, traditional forest management systems are currently being transformed by rapid and far-reaching demographic, political, economic, and environmental changes. The dynamics of population growth, migration into the remaining frontiers, and responses to national and international market forces result in a demand for land to produce food and fiber. These results illustrate some of the mechanisms that drive current land use changes, especially in the tropical forest frontiers. By linking the outcome of individual land use decisions and measures of landscape fragmentation and change, the aggregated results shows the hierarchy of temporal and spatial events that in summation result in global changes to the most complex and sensitive biome – tropical forests. By quantifying the spatial and temporal patterns of tropical forest change, researchers can assist policy makers by showing how landscape systems in these tropical forests are controlled by physical, biological, social, and economic parameters.

24561 (ANL/EAD/TM–38-Vol.1) **Remedial investigation sampling and analysis plan for J-Field, Aberdeen Proving Ground, Maryland. Volume 1: Field Sampling Plan.** Benioff, P.; Biang, R.; Dolak, D.; Dunn, C.; Martino, L.; Patton, T.; Wang, Y.; Yuen, C. Argonne National Lab., IL (United States). Mar 1995. 198p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95011643. Source: OSTI; NTIS; GPO Dep.

The Environmental Management Division (EMD) of Aberdeen Proving Ground (APG), Maryland, is conducting a remedial investigation and feasibility study (RI/FS) of the J-Field area at APG pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended. J-Field is within the Edgewood Area of APG in Harford County, Maryland (Figure 1. 1). Since World War II activities in the Edgewood Area have included the development, manufacture, testing, and destruction of chemical agents and munitions. These materials were destroyed at J-Field by open burning and open detonation (OB/OD). Considerable archival information about J-Field exists as a result of efforts by APG staff to characterize the hazards associated with the site. Contamination of J-Field was first detected during an environmental survey of the Edgewood Area conducted in 1977 and 1978 by the US Army Toxic and Hazardous Materials Agency (USATHAMA) (predecessor to the US Army Environmental Center [AEC]). As part of a subsequent USATHAMA -environmental survey, 11 wells were installed and sampled at J-Field. Contamination at J-Field was also detected during a munitions disposal survey conducted by Princeton Aqua Science in 1983. The Princeton Aqua Science investigation involved the installation and sampling of nine

wells and the collection and analysis of surficial and deep composite soil samples. In 1986, a Resource Conservation and Recovery Act (RCRA) permit (MD3-21-002-1355) requiring a basewide RCRA Facility Assessment (RFA) and a hydrogeologic assessment of J-Field was issued by the US Environmental Protection Agency (EPA). In 1987, the US Geological Survey (USGS) began a two-phased hydrogeologic assessment in data were collected to model, groundwater flow at J-Field. Soil gas investigations were conducted, several well clusters were installed, a groundwater flow model was developed, and groundwater and surface water monitoring programs were established that continue today.

24562 (ANL/EAD/TM–39) **Work plan for focused feasibility study of the toxic burning pits area at J-Field, Aberdeen Proving Ground, Maryland.** Biang, C.; Benioff, P.; Martino, L.; Patton, T. Argonne National Lab., IL (United States). Environmental Assessment Div. Mar 1995. 87p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95011641. Source: OSTI; NTIS; GPO Dep.

The Environmental Management Division (EMD) of Aberdeen Proving Ground (APG), Maryland, is conducting a remedial investigation and feasibility study (RI/FS) of the J-Field area at APG pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act, as amended (CERCIA). J-Field is within the Edgewood Area of APG in Harford County, Maryland. Since World War II, activities in the Edgewood Area have included the development, manufacture, testing, and destruction of chemical agents and munitions. These materials were destroyed at J-Field by open burning and open detonation (OB/OD). Considerable archival information about J-Field exists as a result of efforts by APG staff to characterize the hazards associated with the site. 24563 (ANL/EAD/TM–45) **Work plan for conducting an ecological risk assessment at J-Field, Aberdeen Proving Ground, Maryland.** Hlohowskyj, I. (Argonne National Lab., IL (United States). Environmental Assessment Div.); Hayse, J.; Kuperman, R. Argonne National Lab., IL (United States). Mar 1995. 174p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95015178. Source: OSTI; NTIS; GPO Dep.

The Environmental Management Division of Aberdeen Proving Ground (APG), Maryland, is conducting a remedial investigation and feasibility study (RI/FS) of the J-Field area at APG pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended. J-Field is within the Edgewood Area of APG in Harford County, Maryland, and activities at the Edgewood Area since World War II have included the development, manufacture, testing, and destruction of chemical agents and munitions. The J-Field site was used to destroy chemical agents and munitions by open burning and open detonation. This work plan presents the approach proposed to conduct an ecological risk assessment (ERA) as part of the RI/FS program at J-Field. This work plan identifies the locations and types of field studies proposed for each area of concern (AOC), the laboratory studies proposed to evaluate toxicity of media, and the methodology to be used in estimating doses to ecological receptors and discusses the approach that will be used to estimate and evaluate ecological risks at J-Field. Eight AOCs have been identified at J-Field, and the proposed ERA is designed to evaluate the potential for adverse impacts to ecological receptors from contaminated media at each AOC, as well as over the entire J-Field site. The proposed ERA approach consists of three major phases, incorporating field and laboratory studies as well as modeling. Phase 1 includes biotic surveys of the aquatic and terrestrial habitats, biological tissue sampling and analysis, and media toxicity testing at each AOC and appropriate reference locations. Phase 2 includes definitive toxicity testing of media from areas of known or suspected contamination or of media for which the Phase 1 results indicate toxicity or adverse ecological effects. In Phase 3, the uptake models initially developed in Phase 2 will be finalized, and contaminant dose to each receptor from all complete pathways will be estimated.

24564 (CONF-950209–8) **Assays and screening of alpha contaminated soils using low-resolution alpha spectroscopy of thick soil samples.** Meyer, K.E. (Oak Ridge National Lab., TN (United States)); Lucas, A.C.; Padovan, S. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. ttp # OR158102. From 4. international symposium on field screening methods for hazardous wastes and toxic chemicals; Las Vegas, NV (United States); 22-24 Feb 1995. Order Number DE95008969. Source: OSTI; NTIS; INIS; GPO Dep.

A new approach to estimating concentrations of alpha-emitting contaminants (e.g. U, Th, Ra, Pu, Am) in soil samples has been evaluated. The Victoreen Alpha Activity Monitor has been designed to empirically assay soil samples using low-resolution alpha spectroscopy, of thick soil samples. Pre-processing of the soil samples is minimal, involving only drying the soils and milling them to reduce inhomoceneities. Several laboratory tests of the instrument have been conducted. It has been shown that the instrument obeys simple counting statistics with measurement reproducibility improving with the inverse square root of the counting time. Using acquisition times of 1 to 24 hours the instrument Generated alpha assays of eighteen reference and field soil samples which were in good agreement with radiochemical analyses. It was observed that the alpha activity due to a 10pCi/g ^{239}Pu spike added to a clean soil could be very readily distinguished from the 14pCi/g background activity of the soil. In a mock field screening test of 100 Pu-contaminated soils, the instrument demonstrated screening success rates ranging from 70% (at a screening level of 5pCi/g) to greater than 90% (at a screening level of 30pCi/g).

24565 (CONF-950450–10) **High resolution airborne geophysics at hazardous waste disposal sites.** Beard, L.P. (Oak Ridge National Lab., TN (United States)); Nyquist, J.E.; Doll, W.E.; Chong Foo, M.; Gamey, T.J. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 8. annual symposium on the application of geophysics to environmental and engineering problems; Orlando, FL (United States); 23-27 Apr 1995. Order Number DE95013050. Source: OSTI; NTIS; GPO Dep.

In 1994, a high resolution helicopter geophysical survey was conducted over portions of the Oak Ridge Reservation, Tennessee. The 1800 line kilometer survey included multi-frequency electromagnetic and magnetic sensors. The areas covered by the high resolution portion of the survey were selected on the basis of their importance to the environmental restoration effort and on data obtained from the reconnaissance phase of the airborne survey in which electromagnetic, magnetic, and radiometric data were collected over the entire Oak Ridge Reservation in 1992–1993. The high resolution phase had lower sensor heights, more and higher EM frequencies, and tighter line spacings than did the reconnaissance survey. When flying over exceptionally clear areas, the high resolution bird came within a few meters of the ground surface. Unfortunately, even sparse trees and power or phone lines could prevent the bird from being towed safely at low altitude, and over such areas it was more usual for it to be flown at about the same altitude as the bird in the reconnaissance survey, about 30m. Even so, the magnetometers used in the high resolution phase were 20m

closer to the ground than in the reconnaissance phase because they were mounted on the tail of the bird rather than on the tow cable above the bird. The EM frequencies used in the high resolution survey ranged from 7400Hz to 67000Hz. Only the horizontal coplanar loop configuration was used in the high resolution flyovers.

24566 (CONF-951006–10) **Estimation of contaminant transport in groundwater beneath radioactive waste disposal facilities.** Wang, J.C.; Tauxe, J.D.; Lee, D.W. Oak Ridge National Lab., TN (United States). 25 May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Winter meeting of the American Nuclear Society; San Francisco, CA (United States); 29 Oct - 1 nov 1995. Order Number DE95014577. Source: OSTI; NTIS; INIS; GPO Dep.

Performance assessments are required for low-level radioactive waste disposal facilities to demonstrate compliance with the performance objectives, consider human exposures from water, air, and inadvertent intruder pathways. Among these, the groundwater pathway analysis usually involves complex numerical simulations with results which are often difficult to verify and interpret. This paper presents a technique to identify and simplify the essential parts of the groundwater analysis. The transport process of radionuclides including infiltration of precipitation, leachate generation, and advection and dispersion in the groundwater is divided into several steps. For each step, a simple analytical model is constructed and refined to capture the dominant phenomena represented in the complex analysis included in a site-specific performance assessment. This step-wise approach provides a means for gaining insights into the transport process and obtaining reasonable estimates of relevant quantities for facility design and site evaluation.

24567 (DOE/AL/62350–99-Rev.1) **UMTRA Project water sampling and analysis plan, Salt Lake City, Utah. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1995. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95015576. Source: OSTI; NTIS; INIS; GPO Dep.

This water sampling and analysis plan describes planned, routine ground water sampling activities at the US Department of Energy Uranium Mill Tailings Remedial Action Project site in Salt Lake City, Utah. This plan identifies and justifies sampling locations, analytical parameters, detection limits, and sampling frequencies for routine monitoring of ground water, sediments, and surface waters at monitoring stations on the site.

24568 (DOE/AL/62350–187) **Long-term surveillance plan for the Falls City Disposal Site, Falls City, Texas.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1995. 135p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95013796. Source: OSTI; NTIS; INIS; GPO Dep.

This long-term surveillance plan (LTSP) for the Uranium Mill Tailings Remedial Action (UMTRA) Project Falls City disposal site, Falls City, Texas, describes the surveillance activities for the disposal site. DOE will carry out these activities to ensure that the disposal cell continues to function as designed. This LTSP was prepared as a requirement for acceptance under the US Nuclear Regulatory Commission (NRC) general license for custody and long-term care of residual radioactive materials. This LTSP documents whether the land and interests are owned by the United States and details how long-term care of the disposal site will be carried out. It is based on the DOE's Guidance for Implementing the UMTRA Project Long-term Surveillance Program (DOE, 1992a).

24569 (DOE/AL/85832–T4) **Environmental restoration at the Pantex Plant. Quarterly progress report, April 12, 1995–June 30, 1995.** Charbeneau, R.J. Texas Univ., Austin, TX (United States). Center for Research in Water Resources. 19 Jun 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-95AL85832. Order Number DE95015524. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the Work Plans for activities associated with Environmental Restoration of the perched aquifer and contaminated soils at the Pantex Plant. The Higher Education Consortium/ Pantex Research Laboratory is participating in the Consortium Grant to evaluate subsurface remediation alternatives for the perched aquifer at the Pantex Plant. Research activities will develop site characterization data and evaluate remediation alternatives for the perched aquifer and the overlying vadose zone. The work plans cover research activities for the remainder of FY95, and proposed activities for FY96 and thereafter. A separate document will present more detailed plans for FY96 activities and budget requirements.

24570 (DOE/AL/85832–T5) **Explosives disposal demonstration projects. Progress report, April 12, 1995–June 30, 1995.** Charbeneau, R. Amarillo National Resource Center for Plutonium, TX (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-95AL85832. Order Number DE95015525. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains quarterly reports on two projects. The first is undertaking the environmental restoration at the Pantex Plant. Research objectives are organized under four general tasks: field testing and produced water treatment, bioremediation of contaminated groundwater and soils, vadose zone remediation, and chromium remediation. The other project goal is to demonstrate generation of diamond by explosive compression of Carbon 60 and Carbon 70 and mixtures of these fullerenes. The intent is to exploit expertise developed by Pantex and other DOE Laboratories in the area of understanding and modeling of explosive compression for initiation of nuclear fission reactions to explosively compress carbon in the form of fullerenes with the goal of transforming the material into the diamond phase.

24571 (DOE/BP–2586) **Asotin Creek Model Watershed Plan.** Browne, D.; Holzmiller, J.; Koch, F.; Polumsky, S.; Schlee, D.; Thiessen, G.; Johnson, C. Asotin County Conservation District, Clarkston, WA (United States). Landowner Steering Committee. Apr 1995. 211p. Sponsored by USDOE, Washington, DC (United States). U.S.Department of Agriculture; U.S.Forestry Service; Washington Order Number DE95014643. Source: OSTI; NTIS; GPO Dep.

The Asotin Creek Model Watershed Plan is the first to be developed in Washington State which is specifically concerned with habitat protection and restoration for salmon and trout. The plan is consistent with the habitat element of the "Strategy for Salmon". Asotin Creek is similar in many ways to other salmon-bearing streams in the Snake River system. Its watershed has been significantly impacted by human activities and catastrophic natural events, such as floods and droughts. It supports only remnant salmon and trout populations compared to earlier years. It will require protection and restoration of its fish habitat and riparian corridor in order to increase its salmonid productivity. The watershed coordinator for the Asotin County Conservation District led a locally based process that combined local concerns and knowledge with technology from several agencies to produce the Asotin Creek Model Watershed Plan.

24572 (DOE/EH/79003–T3) **Technical support services to assist the Office of Environmental Audit in conducting the DOE Environmental Survey and to provide technical assistance on Environmental Compliance issues. Technical progress report, February 16, 1990–August 13, 1990.** NUS Corp., Gaithersburg, MD (United States). [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-87EH79003. Order Number DE95014970. Source: OSTI; NTIS; GPO Dep.

NUS received authorization from DOE on August 14, 1987 to provide technical support services to assist the Office of Environmental Audit (OEV) in conducting the DOE Environmental Survey and to provide technical assistance on environmental compliance issues. The overall contract is to accomplish a one-time, no-fault baseline Survey of all DOE operating facilities, and to provide technical assistance and support for the resolution of environmental compliance issues. NUS has completed the Preliminary Reports and continues to support DOE on the Prioritization and Tiger Team Assessment efforts. The project requires a broad range of environmental protection expertise, necessitating senior-level personnel as the primary project staff. Many of the tasks assigned by DOE require quick startup and performance, and several tasks may be active at any one time.

24573 (DOE/EH/79003–T4) **Technical support services to assist the Office of Environmental Audit in conducting the DOE Environmental Survey and to provide technical assistance on Environmental Compliance issues. Technical progress report, August 14, 1990–February 15, 1991.** NUS Corp., Gaithersburg, MD (United States). [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-87EH79003. Order Number DE95014969. Source: OSTI; NTIS; GPO Dep.

NUS received authorization from DOE on August 14, 1987 to provide technical support services to assist the Office of Environmental Audit (OEV) in conducting the DOE Environmental Survey and to provide technical assistance on environmental compliance issues. The overall contract is to accomplish a one-time, no-fault baseline Survey of all DOE operating facilities, and to provide technical assistance and support for the resolution of environmental compliance issues. NUS'role is to technically assist the Office of Environmental Audit in the implementation of the Surveys.

24575 (DOE/EM–0248) **Contaminant plumes containment and remediation focus area. Technology summary.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development. Jun 1995. 244p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016125. Source: OSTI; NTIS; INIS; GPO Dep.

EM has established a new approach to managing environmental technology research and development in critical areas of interest to DOE. The Contaminant Plumes Containment and Remediation (Plumes) Focus Area is one of five areas targeted to implement the new approach, actively involving representatives from basic research, technology implementation, and regulatory communities in setting objectives and evaluating results. This document presents an overview of current EM activities within the Plumes Focus Area to describe to the appropriate organizations the current thrust of the program and developing input for its future direction. The Plumes Focus Area is developing remediation technologies that address environmental problems associated with certain priority contaminants found at DOE sites, including radionuclides, heavy metals, and dense non-aqueous phase liquids (DNAPLs). Technologies for cleaning up contaminants of concern to both DOE and other federal agencies, such as volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), and other organics and inorganic compounds, will be developed by leveraging resources in cooperation with industry and interagency programs.

24576 (DOE/ER/61888–1) **Assessing the impacts of climate change on natural resource systems.** Frederick, K.D.; Rosenberg, N.J. (eds.). Resources for the Future, Inc., Washington, DC (United States). Dept. of Energy and Natural Resources. 30 Nov 1994. 384p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI02-94ER61888. Order Number DE95008993. Source: OSTI; NTIS; GPO Dep.

This volume is a collection of papers addressing the theme of potential impacts of climatic change. Papers are entitled Integrated Assessments of the Impacts of Climatic Change on Natural Resources: An Introductory Editorial; Framework for Integrated Assessments of Global Warming Impacts; Modeling Land Use and Cover as Part of Global Environmental Change; Assessing Impacts of Climatic Change on Forests: The State of Biological Modeling; Integrating Climatic Change and Forests: Economic and Ecological Assessments; Environmental Change in Grasslands: Assessment using Models; Assessing the Socio-economic Impacts of Climatic Change on Grazinglands; Modeling the Effects of Climatic Change on Water Resources- A Review; Assessing the Socioeconomic Consequences of Climate Change on Water Resources; and Conclusions, Remaining Issues, and Next Steps.

24577 (DOE/ID/12735–T35) **Projects at the Western Environmental Technology Office. Quarterly technical progress report, January 1–March 31, 1995.** MSE, Inc., Butte, MT (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88ID12735. Order Number DE95013077. Source: OSTI; NTIS; GPO Dep.

This quarterly report briefly describes recent progress in eight projects. The projects are entitled Biomass Remediation Project; Heavy Metal-Contaminated Soil Project; MHD Shutdown; Mine Waste Technology Program; Plasma Projects; Resource Recovery Project; Spray Casting Project; and Watervliet Arsenal Project.

24578 (DOE/NV/10845–53) **Fate and transport processes controlling the migration of hazardous and radioactive materials from the Area 5 Radioactive Waste Management Site (RWMS).** Estrella, R. Nevada Univ., Reno, NV (United States). Desert Research Inst. Oct 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE95013100. Source: OSTI; NTIS; INIS; GPO Dep.

Desert vadose zones have been considered as suitable environments for the safe and long-term isolation of hazardous wastes. Low precipitation, high evapotranspiration and thick unsaturated alluvial deposits commonly found in deserts make them attractive as waste disposal sites. The fate and transport of any contaminant in the subsurface is ultimately determined by the operating retention and transformation processes in the system and the end result of the interactions among them. Retention (sorption) and transformation are the two major processes that affect the amount of a contaminant present and available for transport. Retention processes do not affect the total amount of a contaminant in the soil system, but rather decrease or eliminate the amount available for transport at a given point in time. Sorption reactions retard the contaminant migration. Permanent binding of solute by the sorbent is also possible. These processes and their interactions are controlled by the nature of the hazardous waste, the properties of the porous media and the geochemical and environmental conditions (temperature, moisture and vegetation). The present study summarizes the available data and investigates the fate and transport processes that govern the migration of contaminants from the Radioactive Waste Management Site (RWMS) in Area 5 of the Nevada Test Site (NTS). While the site is currently used only for low-level radioactive waste disposal, past practices have included burial of material now considered hazardous. Fundamentals of chemical and biological transformation processes are discussed subsequently, followed by a discussion of relevant results.

24579 (DOE/OR–2006) **Aqueous-stream uranium-removal technology cost/benefit and market analysis.** Kapline Enterprises, Inc., Knoxville, TN (United States). Mar 1994. 247p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016400. Source: OSTI; NTIS; INIS; GPO Dep.

The primary purpose of this report is to present information that was gathered by Kapline Enterprises, Inc. (KEI) in order to help the Department of Energy (DOE) determine the merit of continued biosorption research funding. However, in the event that funding is continued, it is also intended to help the researchers in their efforts to develop a better uranium-removal process. This report (1) provides a comparison of DOE sites that may utilize aqueous-stream, uranium-removal biosorption technology, (2) presents a comparison of the biosorption and ion exchange processes, and (3) establishes performance criteria by which the project can be measured. It also attempts to provide focus for biosorbent ground-water-remediation research and to ask questions that need to be answered. This report is primarily a study of the US market for technologies that remove uranium from aqueous streams, but it also addresses the international market-particularly for Germany. Because KEI's access to international market information is extremely limited, the material presented in this report represents a best effort to obtain this data. Although uranium-contaminated aqueous streams are a problem in other countries as well, the scope of this report is primarily limited to the US and Germany for two reasons: (1) Germany is the country of the biosorbent-CRADA partner and (2) time constraints.

24580 (DOE/OR/22028–T19) **DOE Oak Ridge Environmental Restoration Program technical support contractor monthly project status report.** Jacobs Engineering Group, Inc., Oak Ridge, TN (United States). Jun 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-93OR22028. Order Number DE95015262. Source: OSTI; NTIS; INIS; GPO Dep.

Jacobs ER Team management focused attention on preparation of FY 1996 work agreements. The Team planned work scope to reflect approximately the same level of budget as was provided for the TSC in FY 1995. The Team reviewed each draft work agreement in detail to assure consistency with DOE guidance. June 1995 activities included: undertaking an initiative to streamline the internal task order revision process; providing support to help strategize a cost-effective means of recycling valuable metals from K-25; and conducting monthly task order reviews in Oak Ridge, Portsmouth and Paaucah.

24581 (DOE/RL–93-64-Rev.2) **Sodium Dichromate expedited response action assessment. Revision 2.** USDOE, Washington, DC (United States). May 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95012047. Source: OSTI; NTIS; INIS; GPO Dep.

The Washington State Department of Ecology (lead agency) and the US Environmental Protection Agency (support agency) recommended that the US Department of Energy perform an expedited response action (ERA) for the Sodium Dichromate Barrel Disposal Landfill. The ERA goal is to reduce the potential for any contaminant migration from the landfill to the soil column, groundwater, and the Columbia River. Because the Sodium Dichromate Barrel Disposal Landfill is the only waste site within the operable unit, this removal action is the final remediation of the 100-IU-4 Operable Unit. A total of 144 anomalies and 11 subsurface zones were inspected and excavated. various homestead debris (wire fencing, wooden posts, and other miscellaneous debris) and about 5,000 crushed barrels were removed and transported to the Hanford Central Landfill. Besides containing crushed drums, four zones included some loose asbestos, one crushed drum full of asbestos, two 5-gal roofing tar cans, a 12-volt vehicle battery, one empty paint can, and used oil and grease containers (about 0.5 gal total). These materials were placed in three 55-gal drums and sent to an offsite hazardous waste disposal facility permitted to receive hazardous materials. Because the cleanup activities removed all hazardous substances, the site is clean and available for unrestricted land use.

24582 (DOE/SR/18159–4) **The effect of soil mineral phases on the abiotic degradation of selected organic compounds. Final report, June 31, 1990–December 31, 1994.** Sandhu, S.S. Claflin Coll., Orangeburg, SC (United States). 31 Dec 1994. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-90SR18159. Order Number DE95014967. Source: OSTI; NTIS; GPO Dep.

Funds were received from the United States Department of Energy to study the effects of soil mineral phases on the rates of abiotic degradation of tetraphenylborate (TPB) and diphenylboronic acid (DPBA). In addition to kaolinite and montmorillonite clay minerals, the role of goethite, corundum, manganite, and rutile in the degradation of organoborates was also evaluated. The effects of DPBA, argon, molecular dioxygen (O_2), temperature, and organic matter on the degradation of organoborates were also measured. The results indicated that TPB and DPBA degraded rapidly on the mineral surfaces. The initial products generated from the degradation of TPB were DPBA and biphenyl; however, further degradation resulted in the formation of phenylboric acid and phenol which persisted even after TPB disappeared. The data also showed that the rate of TPB degradation was faster in kaolinite, a 1:1 clay mineral, than in montmorillonite, a double layer mineral. The initial degradation of TPB by corundum was much higher than goethite, manganite and rutile. However, no further degradation by this mineral was observed where as the degradation of TPB continued by goethite and rutile minerals. Over all, the degradation rate of TPB was the highest for goethite as compared to the other metal oxide minerals. The degradation of TPB and DPBA was a redox reaction where metals (Fe, Al, Ti, Mn) acted as Lewis acids. DPBA and argon retarded the TPB degradation where as molecular oxygen organic matter and temperature increased the rate of TPB disappearance.

24583 (ENEA-RT-AMB–93-20) **Dendrogeomorphology in landslide analysis: State of art.** Margottini, C. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute); Fantucci, R. ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Jan 1994. 24p. Order Number DE95789705. Source: OSTI; NTIS (US Sales Only).

This article summarizes the uses of dendrogeomorphological techniques in landslide analysis. It shows how to study different landslides events through the analysis of living trees. Living trees record any slope inclination variation as if they were natural inclinometers moreover they can be used to date landslide and their stabilization process with time.

24584 (ENEA-RT-AMB–94-30) **Climatic characters of tosco-emiliano apennines.** Fabozzi, C. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute); Naviglio, L.; Serra, F.; Michetti, L. ENEA, Rome (Italy). Area Energia Ambiente e Salute. Jan 1995. 37p. (In Italian). Order Number DE95789771. Source: OSTI; NTIS (US Sales Only).

The study deals with the principal climatic characters of the Tosco-Emiliano Apennines situated between Toscana and Emilia Romagna regions, according with altitude and topography. Ten weather stations, included in the districts of Bologna and Pistoia, are considered. Mean monthly temperatures and monthly rains from Second World War till now are studied. The use of multivariate programs and the application of bioclimatic index has allowed to define in the area four climatic clusters that correspond to different climatic typology. Moreover the vegetational variation of the area in the last forty years has been studied with the use of the existing cartography. The vegetation cover were correlated with the particular climatic trends of temperature and rains since the Second World War.

24585 (ETDE-DE–158) **Biological remediation of contaminated sites. Part project 1: development of microbiological/adsorptive methods for in-situ decontamination. Final report.** Schacht, S.; Sinder, C.; Kappernagel, T.; Pfeifer, F.; Klein, J. DMT-Gesellschaft fuer Forschung und Pruefung mbH, Essen (Germany). Inst. fuer Chemische Umwelttechnologie. May 1995. 123p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 1460521. Order Number DE95790216. Source: OSTI; NTIS (US Sales Only).

For in situ and on site treatment of PAH contaminated soils biotechnological methods were developed and applied. The selection of suitable areas for field experiments was investigated by sampling and hydrogeological investigations. Soil samples were characterized according to their degree of contamination as well as to their microbiological state. Laboratory investigations proved the degradability of PAH up to four condensed rings. For the determination of biodegradability of contaminants a laboratory test system was developed which gives reliable data for biodegradation, degradation rates and restconcentration of contaminated soils. For assessment of soil contaminations several biotests were applied and developed. For PAH contaminated soil analyses of soil eluates with a Microtox bioassay proved to be suitable. Toxicity of soil samples containing PAH could be monitored by microtox bioassay using soil eluates as test samples. Several reactor types for biotreatment of contaminated soil were tested in order to estimate an optimum degree of PAH removal from different types of soils. For the treatment of silty soils a hydraulic fludized bed reactor proved to be most suitable. (orig.)

24586 (FZKA–5521) **The continuous ammonia measurement in the ppb range in aired soil.** Weinlaender, A. Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Inst. fuer Radiochemie; Karlsruhe Univ. (T.H.) (Germany). Fakultaet fuer Chemie. Feb 1995. 142p. Order Number DE95795767. Source: OSTI; NTIS (US Sales Only).

The objective of this work was to find a possibility to measure the concentration of ammonia occuring during chemical processes in nature in the ppb range. Continuous measuring methods were applied in order to work as automated and fast as possible and to avoid measuring errors. The first part of the work deals with the systematic presentation of the current situation of ammonia measuring technology for this low concentration range. The information was gathered through extensive literary research as well as through test measurements and discussions with the relevant manufactures of measuring devices. The second part of the work was dedicated to the practical application of the measuring methods worked out in the first part to determine the NH_3 emission rate of soils. (orig.)

24587 (GFS–25/94) **The variability of the potential radiation exposure to man arising from radionuclides released to the ground water.** Proehl, G.; Mueller, H. GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Inst. fuer Strahlenschutz. Dec 1994. 69p. Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 02E8019. Order Number DE95795720. Source: OSTI; NTIS (US Sales Only); INIS.

The variability of the potential radiation exposure of the population is estimated if radionuclides (Np-237, Tc-99, I-129, Cs-135, Ra-226, U-238) are released to the ground water which is used by man as drinking water for humans and animals, for irrigation of food and feed crops, and for the production of fish in freshwater bodies. Annual effective dose equivalents are calculated assuming a normalized activity concentration in the water of 1 Bq/l for each radionuclide considered. An important aim is the estimation of the uncertainty of the exposure due to the uncertainty and the variability of the input parameters. The estimated frequency distributions of the input parameters were used as a model input and processed with Latin Hypercube Sampling and a Monte-Carlo technique. This estimation is based on an exposure scenario which reflects the present conditions. The critical group for the exposure due to the use of contaminated ground water are for most radionuclides the children of 1 year, although the activity intake of children is much lower than for adults. However the ingestion dose factors for infants are higher; in many cases the differences are higher than a factor of 5. (orig./HP)

24588 (ITRI–145) **Inhalation Toxicology Research Institute Site Environmental report, 1994.** Inhalation Toxicology Research Inst., Albuquerque, NM (United States). May 1995. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76EV01013. Order Number DE95014378. Source: OSTI; NTIS; GPO Dep.

The Inhalation Toxicology Research Institute (ITRI) was constructed in 1960 with the initial purpose of studying human health hazards of inhaling airborne radioactive fission products; its scope was broadened to cover other airborne materials. ITRI has in place an extensive radiological and nonradiological environmental monitoring program which monitors air emissions, groundwater, soil and ambient air around the facility. ITRI is in compliance with air quality and hazardous waste regulations; however, sewage lagoons remain from previous operations. Remediation activities have been begun or are scheduled to begin on these lagoons and on low-level radioactive liquid waste evaporation ponds. Except for the issues mentioned, ITRI is in compliance with all other federal, state, and local regulations.

24589 (JAERI-Tech–94-032) **Physical model simulation for resistivity tomography. An experimental tank and detection limit for a pole-pole array.** Kumata, Masahiro (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ii, Hiroyuki. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 59p. (In Japanese). Order Number DE95789466. Source: OSTI; NTIS; INIS.

Underground hydrology is one of important items for the assessment of the high-level radioactive waste disposal. Rock fractures play an important role in local hydrology in fractured rock mass. In order to develop the technique of rock fracture survey, basic study on resistivity tomography has been carried out using an experimental tank 2x2m square and 2.2m in depth. The tank was filled with a NaCl solution to represent a homogeneous geologic media. A multi-electrode representing electrodes that will be arranged in field was used in the tank for a physical model simulation with 4 different sized fracture models. The detection limit of the resistivity tomography using a pole-pole array was discussed based on the results of both the physical and numerical model simulations. (author) 60 refs.

24590 (K/NSP–274) **IAEA workshop and field trial at the Oak Ridge K-25 Site.** Hembree, D.M. Jr.; Ross, H.H.; Carter, J.A. Oak Ridge K-25 Site, TN (United States). Mar 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. Order Number DE95011838. Source: OSTI; NTIS; INIS; GPO Dep.

In March 1994, members of the International Safeguards Department in the National Security Program Office (NSPO) hosted an environmental monitoring field trial workshop for International Atomic Energy Agency (IAEA) inspectors. The workshop was held at the Oak Ridge K-25 Site and its primary purpose was to train the inspectors in the techniques needed for effective environmental sample collection and handling. The workshop emphasized both sampling theory and practice. First, detailed techniques for swipe, vegetation, soil, biota, and water-associated sampling were covered in the classroom. Subsequently, the inspectors were divided into three groups for actual sample collection in and around the K-25 locale. The collected samples were processed by the Department of Energy (DOE) Network of Analytical Laboratories using established analytical techniques. This activity is part of the IAEA "Programme 93+2 in. assessment of measures to enhance IAEA safeguards.

24591 (K/NSP–275) **Environmental monitoring for detection of uranium enrichment operations: Comparison of LEU and HEU facilities.** Hembree, D.M. Jr.; Carter, J.A.; Ross, H.H. Oak Ridge Y-12 Plant, TN (United States). Mar 1995. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. Order Number DE95010929. Source: OSTI; NTIS; INIS; GPO Dep.

In 1994, the International Atomic Energy Agency (IAEA) initiated an ambitious program of worldwide field trials to evaluate the utility of environmental monitoring for safeguards. Part of this program involved two extensive United States field trials conducted at the large uranium enrichment facilities. The Paducah operation involves a large low-enriched uranium (LEU) gaseous diffusion plant while the Portsmouth facilities include a large gaseous diffusion plant that has produced both LEU and high-enriched uranium (HEU) as well as an LEU centrifuge facility. As a result of the Energy Policy Act of 1992, management of the uranium enrichment operations was assumed by the US Enrichment Corporation (USEC). The facilities are operated under contract by Martin Marietta Utility Services. Martin Marietta Energy Systems manages the environmental restoration and waste management programs at Portsmouth and Paducah for DOE. These field trials were conducted. Samples

included swipes from inside and outside process buildings, vegetation and soil samples taken from locations up to 8 km from main sites, and hydrologic samples taken on the sites and at varying distances from the sites. Analytical results from bulk analysis were obtained using high abundance sensitivity thermal ionization mm spectrometers (TIMS). Uranium isotopics altered from the normal background percentages were found for all the sample types listed above, even on vegetation 5 km from one of the enrichment facilities. The results from these field trials demonstrate that dilution by natural background uranium does not remove from environmental samples the distinctive signatures that are characteristic of enrichment operations. Data from swipe samples taken within the enrichment facilities were particularly revealing. Particulate analysis of these swipes provided a detailed "history" of both facilities, including the assays of the end product and tails for both facilities.

24592 (LA-SUB–95-27-3) **SAMFT3D: Single-phase and multiphase flow and transport in 3 dimensions. Version 1.0, Documentation and user's guide.** Los Alamos National Lab., NM (United States); HydroGeoLogic, Inc., Herndon, VA (United States). Sep 1991. 190p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95013054. Source: OSTI; NTIS; GPO Dep.

SAMFT3D is a three-dimensional, finite element code designed to simulate single-phase and multiphase fluid flow and contaminant transport in porous media. This report documents the single-phase version of the code. The single-phase computational modules have been developed to simulate flow and solute transport in fully or variable saturated porous media. The formulation of the governing equations and the numerical procedures used in these modules are presented. The flow equation is approximated using the Galerkin finite element method. For variably saturated flow problems, nonlinearities due to unsaturated soil properties are treated using Picard or Newton-Raphson iterations. The contaminant transport simulation can account for advection, hydrodynamic dispersion, linear equilibrium sorption, and first-order degradation. Transport of a single component can be handled. The transport equation is approximated using a upstream weighted residual method. Several test problems are presented to verify the code and to demonstrate its utility. These problems range from single one-dimensional to complex three-dimensional problems. This document has been produced as a user's manual. It contains brief information on the code structure along with detailed instructions for input data preparation and sample input and printed output for selected test problems. Also included are instructions for setting up a simulation run and restart procedures.

24593 (LA-SUB–95-93) **Characterization of vegetation properties: Canopy modeling of pinyon-juniper and ponderosa pine woodlands; Final report. Modeling topographic influences on solar radiation: A manual for the SOLARFLUX model.** Rich, P.M.; Hetrick, W.A.; Saving, S.C. Los Alamos National Lab., NM (United States); Kansas Univ., Lawrence, KS (United States). 1994. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95014560. Source: OSTI; NTIS; GPO Dep.

This report is comprised of two studies. The first study focuses on plant canopies in pinyon-juniper woodland, ponderosa pine woodland, and waste sites at Los Alamos National Laboratory which involved five basic areas of research: (1) application of hemispherical photography and other gap fraction techniques to study solar radiation regimes and canopy architecture, coupled with application of time-domain reflectometry to study soil moisture; (2) detailed characterization of canopy architecture using stand mapping and allometry; (3) development of an integrated geographical information system (GIS) database for relating canopy architecture with ecological, hydrological, and system modeling approaches; (4) development of geometric models that simulate complex sky obstruction, incoming solar radiation for complex topographic surfaces, and the coupling of incoming solar radiation with energy and water balance, with simulations of incoming solar radiation for selected native vegetation and experimental waste cover design sites; and (5) evaluation of the strengths and limitations of the various field sampling techniques. The second study describes an approach to develop software that takes advantage of new generation computers to model insolation on complex topographic surfaces. SOLARFLUX is a GIS-based (ARC/INFO, GRID) computer program that models incoming solar radiation based on surface orientation (slope and aspect), solar angle (azimuth and zenith) as it shifts over time, shadows caused by topographic features, and atmospheric conditions. This manual serves as the comprehensive guide to SOLARFLUX. Included are discussions on modelling insolation on complex surfaces, the theoretical approach, program setup and operation, and a set of applications illustrating characteristics of topographic insolation modelling.

24594 (LBL–36400) **T2VOC user's guide.** Falta, R.W. (Clemson Univ., Clemson, SC (United States). Dept. of Earth Sciences); Pruess, K.; Finsterle, S.; Battistelli, A. Lawrence Berkeley Lab., CA (United States). Mar 1995. 155p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95015144. Source: OSTI; NTIS; GPO Dep.

T2VOC is a numerical simulator for three-phase, three-component, non-isothermal flow of water, air, and a volatile organic compound (VOC) in multidimensional heterogeneous porous media. Developed at the Lawrence Berkeley Laboratory, T2VOC is an extension of the TOUGH2 general-purpose simulation program. This report is a self-contained guide to application of T2VOC to subsurface contamination problems involving nonaqueous phase liquids (NAPLs). It gives a technical description of the T2VOC code, including a discussion of the physical processes modeled, and the mathematical and numerical methods used. Detailed instructions for preparing input data are presented along with several illustrative sample problems.

24595 (NUREG–0837-Vol.15-No.1) **NRC TLD Direct Radiation Monitoring Network: Volume 15, No. 1. Progress report, January–March 1995.** Struckmeyer, R. Nuclear Regulatory Commission, King of Prussia, PA (United States). Region I. May 1995. 229p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This report provides the status and results of the NRC Thermoluminescent Dosimeter (TLD) Direct Radiation Monitoring Network. It presents the radiation levels measured in the vicinity of NRC licensed facilities throughout the country for the first quarter of 1995.

24596 (ORNL/RASA–95/4) **Radiological verification survey results at 3 Peck Ave., Pequannock, New Jersey (PJ002V).** Rodriguez, R.E.; Johnson, C.A. Oak Ridge National Lab., TN (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014468. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) conducted remedial action during 1993 at the Pompton Plains Railroad Spur and eight vicinity properties in the Wayne and Pequannock Townships in New Jersey as part of the Formerly Utilized Sites Remedial Action Program (FUSRAP). These properties are in the vicinity of the DOE-owned Wayne Interim Storage Site (WISS), formerly the W.R. Grace facility. The property at 3 Peck Ave., Pequannock, New Jersey is one of these vicinity properties. At the request of DOE, a team from Oak Ridge National Laboratory conducted an independent radiological verification survey at this property. The purpose of the survey, conducted between September and December 1993, was to confirm the success of the remedial actions performed to remove any radioactive materials in excess of the identified guidelines. The verification survey included surface gamma scans and gamma readings at 1 meter, beta-gamma scans, and the collection of soil and debris samples for radionuclide analysis. Results of the survey demonstrated that all radiological measurements on the property at 3 Peck Ave. were within applicable DOE guidelines. Based on the results of the remedial action data and confirmed by the verification survey data, the portions of the site that had been remediated during this action successfully meet the DOE remedial action objectives.

24597 (ORNL/RASA–95/5) **Radiological verification survey results at 7 Peck Ave., Pequannock, New Jersey (PJ003V).** Rodriguez, R.E.; Johnson, C.A. Oak Ridge National Lab., TN (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract AC05-84OR21400. Order Number DE95014469. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) conducted remedial action during 1993 at several vicinity properties in the Wayne and Pequannock Townships in New Jersey as part of the Formerly Utilized Sites Remedial Action Program (FUSRAP). These properties are in the vicinity of the DOE-owned Wayne Interim Storage Site (WISS), formerly the W.R. Grace facility. The property at 914 Black Oak Ridge Road, Wayne, New Jersey was not one of these vicinity properties; however the owner requested that his property be radiologically surveyed. At the request of DOE, a team from Oak Ridge National Laboratory conducted a radiological scoping survey of this property. The purpose of the survey, conducted in early November 1993, was to determine whether any radiological contamination might be present on the property. The radiological survey included surface gamma scans and gamma readings at one meter, and the collection of soil and/or debris samples for radionuclide analysis. Results of the survey demonstrated no radionuclide concentrations or radiation measurements in excess of applicable DOE guidelines.

24604 Removal of radioactive materials and heavy metals form water using magnetic resin. Kochen, R.L. (EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant); Navratil, J.D. 1993. Filed date 7 May 1993. U.S. Patent Application 8-062,512. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP03533 ; AC34-90RF62349. Order Number DE95015048. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Magnetic polymer resins capable of efficient removal of actinides and heavy metals from contaminated water are disclosed together with methods for making, using, and regenerating them. The resins comprise polyamine-epichlorohydrin resin beads with ferrites attached to the surfaces of the beads. Markedly improved water decontamination is demonstrated using these magnetic polymer resins of the invention in the presence of a magnetic field, as compared with water decontamination methods employing ordinary ion exchange resins or ferrites taken separately.

24605 (PNL–10608) **Risk information in support of cost estimates for the Baseline Environmental Management Report (BEMR). Section 1.** Gelston, G.M. (Pacific Northwest Lab., Richland, WA (United States)); Jarvis, M.F.; Warren, B.R.; Von Berg, R. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 302p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015593. Source: OSTI; NTIS; INIS; GPO Dep.

The Pacific Northwest Laboratory (PNL)(1) effort on the overall Baseline Environmental Management Report (BEMR) project consists of four installation-specific work components performed in succession. These components include (1) development of source terms, 92) collection of data and preparation of environmental settings reports, (3) calculation of unit risk factors, and (4) utilization of the unit risk factors in Automated Remedial Action Methodology (ARAM) for computation of target concentrations and cost estimates. This report documents work completed for the Nevada Test Site, Nevada, for components 2 and 3. The product of this phase of the BEMR project is the development of unit factors (i.e., unit transport factors, unit exposure factors, and unit risk factors). Thousands of these unit factors are gene rated and fill approximately one megabyte of computer information per installation. The final unit risk factors (URF) are transmitted electronically to BEMR-Cost task personnel as input to a computer program (ARAM). Abstracted files and exhibits of the URF information are included in this report. These visual formats are intended to provide a sample of the final task deliverable (the URF files) which can be easily read without a computer.

24606 (PNL–10633) **Geologic, geochemical, microbiologic, and hydrologic characterization at the In Situ Redox Manipulation Test Site.** Vermeul, V.R. (and others); Teel, S.S.; Amonette, J.E. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 159p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015839. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents results from characterization activities at the In Situ Redox Manipulation (ISRM) Field Test Site which is located within the 100-HR-3 Operable Unit of the US Department of Energy's (DOE's) Hanford Site in Richland, Washington. Information obtained during hydrogeologic characterization of the site included sediment physical properties, geochemical properties, microbiologic population data, and aquifer hydraulic properties. The purpose of obtaining this information was to improve the conceptual understanding of the hydrogeology beneath the ISRM test site and provide detailed, site specific hydrogeologic parameter estimates. The resulting characterization data will be incorporated into a numerical model developed to simulate the physical and chemical processes associated with the field experiment and aid in experiment design and interpretation.

24607 (PNL-SA–25640) **Effect of temperature on perchloroethylene dechlorination by a methanogenic consortium.** Gao, J.; Skeen, R.S.; Hooker, B.S. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950483–3: 3. international symposium on in situ and on-site bioreclamation, San Diego, CA (United States), 24-27 Apr 1995). Order Number DE95014168. Source: OSTI; NTIS; GPO Dep.

The effect of temperature on the kinetics of growth, substrate metabolism, and perchloroethylene (PCE) dechlorination by a methanogenic consortium is reported. In all cases, a simple kinetic model accurately reflected experimental data. Values for the substrate and methane yield coefficients, and the maximum specific growth rate are fairly consistent at each temperature. Also, the substrate and methane yield coefficients show little temperature sensitivity. In contrast, both the maximum specific growth rate and the PCE dechlorination yield coefficient (Y_{PCE}) are temperature dependent.

24608 (PNL-SA–25678) **The use of bench- and field-scale data for design of an in situ carbon tetrachloride bioremediation system.** Peyton, B.M. (and others); Truex, M.J.; Skeen, R.S. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950483–5: 3. international symposium on in situ and on-site bioreclamation, San Diego, CA (United States), 24-27 Apr 1995). Order Number DE95014194. Source: OSTI; NTIS; INIS; GPO Dep.

A suite of simulation models were developed as a design tool in support of an in situ bioremediation demonstration at the Hanford site in Washington state. The design tool, calibrated with field - and bench-scale data, was used to answer four field-scale system design questions: (1) What are the important reaction processes and kinetics? (2) How will biomass distribute in the aquifer in response to injected substrate? (3) What well configuration best ensures proper nutrient transport and process control? (4) What operating and monitoring strategy should be used to confirm effective remediation? This paper does not describe the design tool itself, but describes how the design tool was used to optimize field site

design parameters such as well spacing, hydraulic control, contaminant destruction, and nutrient injection strategies.

24609 (PNL-SA–25679) **Modeling biologically reactive transport in porous media.** Clement, T.P.; Hooker, B.S.; Skeen, R.S. Pacific Northwest Lab., Richland, WA (United States); Associated Western Universities, Inc., Salt Lake City, UT (United States). Apr 1995. 10p. Sponsored by USDOE, Washington, DC (United States);Associated Western Universities, Inc., Salt Lake City, UT (United States). DOE Contract AC06-76RL01830 ; FG07-93ER75912. (CONF-950420–27: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95014195. Source: OSTI; NTIS; INIS; GPO Dep.

A one-dimensional biofilm-based reactive transport model is developed to simulate biologically mediated substrate metabolism and contaminant destruction in saturated porous media. The resulting equations are solved by a finite-difference based, three-level, operator-split approach. The numerical solution procedure is stable, easy-to-code, and computationally efficient. As an example problem, biological denitrification and fortuitous CT destruction processes in one-dimensional porous media is studied. The simulation results of the example problem show that the present model can be successfully used to predict biological processes and nutrient/contaminant transport in saturated porous media.

24610 (SAND–94-0323C) **Detailed characterization and preliminary adsorption model for materials for an intermediate-scale reactive-transport experiment.** Ward, D.B. (New Mexico Univ., Albuquerque, NM (United States). Dept. of Earth and Planetary Sciences); Bryan, C.R.; Siegel, M.D. Sandia National Labs., Albuquerque, NM (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-940553–84: International high-level radioactive waste management conference, Las Vegas, NV (United States), 22-26 May 1994). Order Number DE95014216. Source: OSTI; NTIS; INIS; GPO Dep.

An experiment involving migration of fluid and tracers (Li, Br, Ni) through a 6-m-high x 3-m-dia caisson Wedron 510 sand, is being carried out for Yucca Mountain Site Characterization Project. Sand's surface chemistry of the sand was studied and a preliminary surface-complexation model of Ni adsorption formulated for transport calculations. XPS and leaching suggest that surface of the quartz sand is partially covered by thin layers of Fe-oxyhydroxide and Ca-Mg carbonate and by flakes of kaolinite. Ni adsorption by the sand is strongly pH-dependent, showing no adsorption at pH 5 and near-total adsorption at pH 7. Location of adsorption edge is independent of ionic strength and dissolved Ni concentration; it is shifted to slightly lower pH with higher pCO2 and to slightly higher pH by competition with Li. Diminished adsorption at alkiline pH with higher pCO2 implies formation of dissolved Ni-carbonato complexes. Ni adsorption edges for goethite and quartz, two components of the sand were also measured. Ni adsorption on pure quartz is only moderately pH-dependent and differs in shape and location from that of the sand, whereas Ni adsorption by goethite is strongly pH-dependent. A triple-layer surface-complexation model developed for goethite provides a good fit to the Ni-adsorption curve of the sand. Based on this model, the apparent surface area of the Fe-oxyhydroxide coating is estimated to be 560 m^2/g, compatible with its occurrence as amorphous Fe-oxyhydroxide. Potentiometric titrations on sand also differ from pure quartz and suggest that effective surface area of sand may be much greater than that measured by N_2-BET gas adsorption. Attempts to model the adsorption of bulk sand in terms of properties of pure end member components suggest that much of the sand surface is inert. Although the exact Ni adsorption mechanisms remain ambiguous, this preliminary adsorption model provides an initial set of parameters that can be used in transport calculations.

24611 (SAND–95-1084C) **Modeling of capillary barriers and comparison to data.** Webb, S.W.; Stormont, J.C. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503116–11: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95013027. Source: OSTI; NTIS; GPO Dep.

Measurements of capillary barrier performance have been conducted in above-grade wooden structures (boxes) configured to measure the water balance. The capillary-barrier portion of the boxes is 6.0 m long, 2.0 m wide, and 1.2 m high with a slope of 5%. A coarse-grained material was placed in the bottom 25-cm of the box with a 90-cm deep fine-grained material (local soil) on top. A region for laterally diverted water to accumulate and drain was created in the last 1.0 m of the box. The soil at the top is terraced into five, 1.4 m long, level intervals to prevent runoff when adding water. Water is added uniformly to the entire top of the box at a rate of about 66 l/day, or an infiltration rate of 1.7 m/year. The top of the box is covered with fiber-reinforced plastic to minimize evaporation of water, discourage plant growth, and prevent rainfall from contacting the soil. Five drains are spaced along the bottom of the coarse layer. These drains discretize the coarse layer into five collection regions to provide a means of identifying the breakthrough location into the coarse layer. A drain is also located in the downdip collection region of the box. Soil moisture changes were measured in the fine-grained material with a frequency-domain reflectometry (FDR) probe, which was calibrated using soil from the field site at a known moisture content and density.

24612 (UCRL-ID–106132-Rev.1) **Environmental monitoring plan - environmental monitoring section. Revision 1.** Wilt, G.C. (ed.) (and others); Tate, P.J.; Brigdon, S.L. Lawrence Livermore National Lab., CA (United States). Nov 1994. 372p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014137. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the environmental monitoring plan for the Lawrence Livermore National Laboratory. A site characterization is provided along with monitoring and measurement techniques and quality assurance measures.

24613 (UCRL-ID–120321) **Compilation of data for isotope mapping of groundwater in the Central Valley of California, 1993-1995.** Davisson, M.L. (Lawrence Livermore National Lab., CA (United States)); Criss, R.E.; Campbell, K.R. Lawrence Livermore National Lab., CA (United States). May 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015131. Source: OSTI; NTIS; INIS; GPO Dep.

A major stable isotope mapping project is underway that will provide important baseline information to the State of California in management of their groundwater resources. The results represent a new technological application using isotope hydrology to better understand and predict the sustainability of California's groundwater supply for the future. This project is driven by the fact that Californians inhabit a semi-arid region of seasonal precipitation, but have created a lifestyle and economic infrastructure requiring a sub-tropical climate. They have accomplished this by engineering systems that store and divert alpine runoff, and by utilizing a large, productive alluvial aquifer. In the past, both of these resources appeared to be unlimited. Today, water shortages are recognized, regardless of drought conditions. Because Californians maintain their current practices of prolific water use, the deep-seated competition between agricultural users and urban consumers has been amplified. This has been aggravated by the acquisition of one-third of the available surface water resources for maintenance of aquatic habitats. The State of California accepts and encourages the use of groundwater to supplement these diverse water demands. Stable isotope imaging of the groundwater resources has proven to be the most economical and effective means to diagnose the health of the giant alluvial aquifer of the Central Valley. Augmented by radiocarbon analysis and nitrate determinations, stable isotope data can be used to clearly distinguish groundwater recharged from natural or anthropogenic sources. Isotope maps delineate (1) the geographic distribution of various groundwater masses and of preferential recharge zones, (2) the sources and extent of non-point source pollution, and (3) the locations and rates of lateral flow channels. Different recharge rates of natural and modern groundwater bodies can be used to characterize safe yield parameters for aquifers.

24614 (UCRL-ID–120322) **Uncertainties associated with the definition of a hydrologic source term for the Nevada Test Site.** Smith, D.K. (Lawrence Livermore National Lab., CA (United

States)); Esser, B.K.; Thompson, J.L. Lawrence Livermore National Lab., CA (United States). May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015130. Source: OSTI; NTIS; GPO Dep.

The U.S. Department of Energy, Nevada Operations Office (DOE/NV) Environmental Restoration Division is seeking to evaluate groundwater contamination resulting from 30 years of underground nuclear testing at the Nevada Test Site (NTS). This evaluation requires knowledge about what radioactive materials are in the groundwater and how they are transported through the underground environment. This information coupled with models of groundwater flow (flow paths and flow rates) will enable predictions of the arrival of each radionuclide at a selected receptor site. Risk assessment models will then be used to calculate the expected environmental and human doses. The accuracy of our predictions depends on the validity of our hydrologic and risk assessment models and on the quality of the data for radionuclide concentrations in ground water at each underground nuclear test site. This paper summarizes what we currently know about radioactive material in NTS groundwater and suggests how we can best use our limited knowledge to proceed with initial modeling efforts. The amount of a radionuclide available for transport in groundwater at the site of an underground nuclear test is called the hydrologic source term. The radiologic source term is the total amount of residual radionuclides remaining after an underground nuclear test. The hydrologic source term is smaller than the radiologic source term because some or most of the radionuclide residual cannot be transported by groundwater. The radiologic source term has been determined for each of the underground nuclear tests fired at the NTS; however, the hydrologic source term has been estimated from measurements at only a few sites.

24615 (WSRC-MS–94-0528) **Uranium partitioning under acidic conditions in a sandy soil aquifer.** Johnson, W.H. (Westinghouse Savannah River Co., Aiken, SC (United States). Savannah River Technology Center); Serkiz, S.M.; Johnson, L.M. Westinghouse Savannah River Co., Aiken, SC (United States); Georgia Inst. of Tech., Atlanta, GA (United States). School of Mechanical Engineering. [1995]. 15p. Sponsored by USDOE, Washington, DC (United States);Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC09-89SR18035 ; AC09-76SR00819. (CONF-950216–152: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95014728. Source: OSTI; NTIS; INIS; GPO Dep.

The partitioning of uranium in an aquifer down gradient of two large mixed waste sites was examined with respect to the solution and soil chemistry (e.g., pH redox potential and contaminant concentration) and aqueous-phase chemical speciation. This involved generation of field-derived, batch sorption, and reactive mineral surface sorption data. Field-derived distribution coefficients for uranium at these waste sites were found to vary between 0.40 and 15,000. Based on thermodynamic speciation modeling and a comparison of field and laboratory data, gibbsite is a potential reactive mineral surface present in modified soils at the sites. Uranium partitioning data are presented from field samples and laboratory studies of background soil and the mineral surface gibbsite. Mechanistic and empirical sorption models fit to the field-derived uranium partitioning data show an improvement of over two orders of magnitude, as measured by the normalized sum of errors squared, when compared with the single K_d model used in previous risk work. Models fit to batch sorption data provided a better fit of sorbed uranium than do models fit to the field-derived data.

24616 (WSRC-MS–95-0187) **The Speciation of Groundwater Contaminated with Coal Pile Leachate at the Savannah River Site, South Carolina.** Denham, M.E.; Nichols, R.L. Westinghouse Savannah River Co., Aiken, SC (United States). 15 May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9506198–1: International Association of Hydro-Geologists Congress: solutions, Edmonton (Canada), 4-10 Jun 1995). Order Number DE95060146. Source: OSTI; NTIS; INIS; GPO Dep.

Modeling the transport of contaminant metals and designing systems for their remediation requires an understanding of the metal's speciation. Thus, analysis of contaminant speciation and evaluation of the processes that can change the speciation should be done during characterization of the contaminated site. This approach is being used at the Savannah River Site for a metals contaminated site that will serve as a test platform for metals remediation technologies. The site is adjacent to a coal storage pile and the basin that contains the coal pile runoff. A network of well clusters allows definition of the plume, including profiles of contamination with depth. The groundwater is acidic (pH $\approx$ 2) and contains high concentrations of sulfate (up to 2300 mg/l) and metals, with chromium, nickel, cadmium and lead exceeding drinking water standards. Aluminum and total iron concentrations range up to 1326 mg/l and 7991 mg/l, respectively. Speciation calculations on dissolved contaminants indicate that as much as 65% of the lead, 54% of the cadmium, and 34% of the nickel may be present in sulfate complexes. Chromium occurs predominantly as Cr^{+3}. There is evidence that some contaminant metals may be associated with colloidal material. Contamination in the groundwater is stratified with concentrations decreasing over a depth range of 3 meters (10 feet). Fluid-rock interactions explain the non-uniform behavior of dissolved components with depth. Mass balance considerations suggest that the interactions are dominated by Kaolinite dissolution coupled with precipitation of phases containing aluminum, ferric iron, silica, and sulfate, as well as co- precipitation of contaminant metals.

Order Number DE95013511. Source: OSTI; NTIS; INIS; GPO Dep.

We analyzed gas absorption and release in water bodies using existing surface renewal theory. We show a new relation between turbulent momentum and mass transfer from gas to water, including the effects of waves and wave roughness, by evaluating the equilibrium integral turbulent dissipation due to energy transfer to the water from the wind. Using Kolmogoroff turbulence arguments the gas transfer velocity, or mass transfer coefficient, is then naturally and straightforwardly obtained as a non-linear function of the wind speed drag coefficient and the square root of the molecular diffusion coefficient. In dimensionless form, the theory predicts the turbulent Sherwood number to be $Sh_t = (2/\sqrt{\pi})Sc^{1/2}$, where Sh_t is based on an integral dissipation length scale in the air. The theory confirms the observed nonlinear variation of the mass transfer coefficient as a function of the wind speed; gives the correct transition with turbulence-centered models for smooth surfaces at low speeds; and predicts experimental data from both laboratory and environmental measurements within the data scatter. The differences between the available laboratory and field data measurements are due to the large differences in the drag coefficient between wind tunnels and oceans. The results also imply that the effect of direct aeration due to bubble entrainment at wave breaking is no more than a 20% increase in the mass transfer for the highest speeds. The theory has importance to mass transfer in both the geo-physical and chemical engineering literature.

24618 (BNL–61827) **Basic programs for the CO_2 system in seawater.** Lewis, E.R.; Wallace, D.W.R. Brookhaven National Lab., Upton, NY (United States). May 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95013314. Source: OSTI; NTIS; GPO Dep.

The CO_2 system in seawater is characterized by four measurable parameters: TA, the total alkalinity; TC, the total (inorganic)

CO_2 (the sum of the dissolved CO_2, the carbonate, and the bicarbonate); pH; and either fCO_2, the fugacity of CO_2, or xCO_2, the mole fraction of CO_2 in air. Ta and TC are independent of temperature; fCO_2, xCO_2, and pH are not. The knowledge of any two of these parameters, along with the temperature, the salinity, the abundances of other constituents of seawater, and the relevant equilibrium constants, allows the determination of the other two. There are four programs in this package: CO2SYSTM.EXE; FCO2TCO2.EXE; PHTCO2.EXE; CO2BTCH.EXE. They are designed to be run on any 80 x 86 computer equipped with the DOS operating system. They are run simply by typing the program name from the command line. All input data for these programs should be in micromoles per kilogram of solution (μmol/kg-soln), microatmospheres (μatm) in the case of fCO_2, and parts per million (ppm) in the case of xCO_2. The pH should be on the total scale. All outputs are in these units also. Each program in this package allows a choice from the four sets of constants K_1 and K_2: those of Roy et al., Goyet and Poisson, Hansson and Mehrbach et al.

24619 (CONF-940277–, pp. 55-58) **Special working session on the role of buoy observations in the tropical Western Pacific measurement scheme.** Downing, J. (Marine Sciences Lab., Sequim, WA (United States)); Reynolds, R.M. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The purpose of this session was to discuss the scientific merits of retrofitting TOGA/TAO buoys with shortwave radiometers. Three questions were posed at the outset to focus the discussion: Does the ARM Program need widespread radiometric measurements in the Tropical Western Pacific (TWP) locale to augment the five Atmospheric Radiation and Cloud Stations and future ocean sites already planned; If there is a need, can buoy-based radiometers with satellites and other measurement platforms provide useful data; If buoy-based radiometric measurements were made, who would use them?

24620 (CONF-940277–, pp. 59-64) **A short-wave radiometer array across the tropical Pacific Ocean as a component of the TOGA-TAO buoy array.** Reynolds, R.M. (Brookhaven National Lab., Upton, NY (United States)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The purpose of this document is to bring together pertinent information concerning the NOAA TOGA-TAO buoy array so that a decision can be made for the following questions: (1) Are the scientific gains from an array of short-wave radiation sensors in the equatorial Pacific Ocean sufficiently impelling that DOE/ARM should provide financial and material support to NOAA/PMEL to install and operate this array? (2) What scientists and/or scientific studies would directly benefit from such a data set? (3) What should that array look like? That is, what sub-set of buoys should be so implemented given the per-buoy cost of the implementation?

24621 (CONF-940277–, pp. 81-84) **The role of water vapor, clouds, and the large-scale circulation in regulating sea surface temperatures in the tropical Pacific.** Arking, A. (Johns Hopkins Univ., Baltimore, MD (United States)). USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The western tropical Pacific is characterized by unusually warm sea surface temperatures - the so-called "warm pool" - with an asymmetric temperature distribution. The role of clouds and water vapor in determining the region's unique character has been the subject of a number of recent papers. They have fueled a debate on what maintains the warm pool, on the relative role of radiation and dynamics in determining sea surface temperatures, and on possible feedback mechanisms involving clouds and water vapor. A statistical analysis of four years of observations over the tropical Pacific has provided some insight and suggests an explanation based on a greenhouse instability that is quenched when high-level clouds develop in response to increasing sea surface temperatures. The data used in this study include earth radiation budget parameters from the Earth Radiation Budget Experiment (ERBE), cloud parameters from the International Satellite Cloud Climatology Project (ISCCP), total column water vapor from the National Oceanic and Atmospheric Administration's (NOAA) TIROS operational vertical sounder (TOVS), and sea surface temperatures from NOAA based on a blend of AVHRR (advanced very high resolution radiometer) and in situ measurements. The data consist of monthly averages on a 2.5° latitude by 2.5° longitude grid, extending from 150E to 180E and 25S to 25N, for the period February 1985 through January 1989.

24622 (CONF-940277–, pp. 115-118) **Observations from the central equatorial Pacific Experiment and their significance to siting and modeling objectives of the Atmospheric Radiation Measurement Program.** Corral, J. del (Univ. of California, San Diego, La Jolla, CA (United States)); Boer, E.; Collins, W.; Conant, W.; Lubin, D.; McFarquhar, G.; Ramanathan, V.; Sherwood, S.; Grassl, H.; Heymsfield, A. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

The Central Equatorial Pacific Experiment (CEPEX) was motivated by the fact that sea surface temperatures (SST) in the world's oceans exhibit significant spatial gradients except for those regions where the SST exceed 27 (degrees)C (or 300K). In such warm oceans, the gradients diminish such that the maximum SST is within a few degrees of 27 (degrees)C. The tropical western Pacific is an important example of this outstanding and, as yet, unexplained phenomenon and is referred to as the western Pacific warm pool. Recent work suggests that the link between the warm ocean, deep convection, cirrus formation, and reduction of sea surface solar heating regulate maximum SSTs like a thermostat. CEPEX was conducted from March 5 to April 7, 1993 and utilized buoy measurements, aircraft measurements, vaisala sonde, dropsonde, and FTIR spectrography. One of the most powerful analysis tools to come out of CEPEX is the CEPEX Integrated Data System (CIDS). This system is an ongoing effort to provide scientists with a self-contained software and data system that will allow them to collocate any measurement taken during CEPEX, analyzed fields, and model results. CIDS will also provide a gridded synoptic scale estimate of the atmospheric column heat budget terms, binned by SST and convective activity. These estimates will be derived from all the available CEPEX measurements. This information will give GCM modelers more understanding of the tropical Pacific.

24623 (CONF-940277–, pp. 217-221) **The effects of radiative transfer in maintaining the Indian summer monsoon.** Leach, M.J. (North Carolina State Univ., Raleigh, NC (United States)); Raman, S. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Apr 1995. From Atmospheric radiation measurement science team meeting; Charleston, SC (United States); 28 Feb - 3 mar 1994. In *Proceedings of the Fourth Atmospheric Radiation Measurement (ARM) Science Team Meeting.* 373p. Order Number DE95009951. Source: OSTI; NTIS; GPO Dep.

Atmospheric radiative transfer is an important thermodynamic forcing for the Indian summer monsoon. The monsoon is a component of a larger scale circulation system the principal components of which are the Hadley cell and the Walker Circulation. The Hadley cell is a thermally direct circulation that transports heat toward the poles. In the northern hemispheric summer, the ascending branch of the Hadley cell moves northward, due to heating of the land masses. This ascending branch of the Hadley cell is referred to as the Intertropical Convergence Zone (ITCZ). The return

branch of the Hadley cell is characterized by southwesterly surface winds. At the surface, the ITCZ is marked by convergence of southwesterly surface winds from the south and northeasterly surface winds from the north. As the ITCZ moves northward, the southern extent of the northerly surface winds also moves northward, and southerly surface winds from the south side of the ITCZ also move northward. The surface convergence at the ITCZ is a driving mechanism for the summer monsoon circulation. The northward drift of the Hadley cell in the northern summer ITCZ is the deep convection over the warm pool of water in the western tropical Pacific ocean, located at about 160E. The latent heating in the deep convection drives another direct circulation, known as the Walker Circulation. The upper branch of the Walker Circulation over south Asia is easterly winds created by the deep convection in the western tropical Pacific. Convective activity over the Indian peninsula interacts with the Walker Circulation, creating a jet structure over the western part of India and the eastern Arabian Sea. This structure is known as the Tropical Easterly Jet (TEJ). Secondary circulations associated with the Indian convection also help to maintain the baroclinicity, which is essential to the development of monsoon depression, the maintenance of the monsoon trough, and the circulation and hydrology of the region in general.

24624 (CONF-9406323–2) **Toxicity testing strategies for assessing water-quality conditions in receiving streams.** Stewart, A.J. Oak Ridge National Lab., TN (United States). [1994]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 3. annual workshop on industrial ecology; Wood Hole, MA (United States); 25-26 Jun 1994. Order Number DE95012300. Source: OSTI; NTIS; GPO Dep.

This paper explores the use of short-term, EPA-approved laboratory toxicity tests for assessing water-quality conditions in streams and rivers. Strategies for the cost-effective application of such tests for long-term monitoring objectives are considered in the context of logistic constraints and statistical design. A subtle but important difference in objectives for effluent versus ambient testing is this: in effluent testing for regulatory purposes, a key objective is to determine how toxic an effluent is; in ambient testing, the main objective usually is that of determining if the water at a site is toxic. This difference shapes the strategy for cost-effective ambient testing and determines the framework for effective statistical analysis and interpretation of ambient toxicity test results. Recommendations derived as " lessons learned" from large-scale ambient toxicity testing programs for receiving streams at Department of Energy (DOE) facilities include: (1) testing more frequently with one species (preferably Ceriodaphnia) generally is more effective, in terms of information gained per dollar spent, than testing less frequently with two or more species; (2) use five or more sites per test period, plus two or more reference sites, whenever possible; (3) use four to six test periods per year; and (4) use diagnostic testing to supplement the ambient-testing program. Various laboratory and in situ methods for environmental assessment are now under development, but these methods probably will not gain acceptance for use in regulatory situations for many years. Rapid growth in need for ecological risk assessments outstrips the rate at which new test procedures are approved for regulatory purposes. Thus, laboratory tests for estimating possible environmental impacts of toxic or disruptive pollutants are likely to be used more frequently, not less frequently, during the next decade.

24625 (CRIE-U–94017) **Development of technologies to hasten the growth of Japanese flounder. 4. Effects of temperature on the growth of Japanese flounder.** Iwata, N. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Kikuchi, K.; Furuta, T.; Honda, H.; Kiyono, M. Central Research Inst. of Electric Power Industry, Abiko, Chiba (Japan). Aug 1994. 35p. (In Japanese). Order Number DE95790561. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

Effects of temperature were examined on the growth of flounder from the juvenile to the immature in a flounder culture system in order to promote regional fisheries. Rearing experiments were carried out on the juvenile, young 1, young 2 and immature of the flounder at constant water temperatures at 10, 15, 25, and 30°C for 20 days. Feeds sold in the market were given twice a day to a satiation level. The ratio of increase in body weight per day rose with the rise in water temperature in every developmental stage, reaching the maximum at 20 or 25°C and declining at 30°C. The feeding rates per day for the body weight indicated the similar tendency. The ratio of increase in body weight over feeding rates slightly declined at 25°C as compared at 20°C. The ratio of increase in body weight per day remarkably declined in the young 2 and the immature at a high temperature of 30°C. It was revealed that the optimum temperature for the growth of flounder during the developmental stage from the juvenile to the immature exists between 20 and 25°C. It was also revealed that, for flounder after the developmental stage of the young 2, the growth rate declined remarkably as the water temperature rose close to a high temperature of 30°C. 32 refs., 20 figs., 6 tabs.

24626 (DOE/BP/21708–3) **Identification of the spawning, rearing, and migratory requirements of fall chinook salmon in the Columbia River Basin. Annual report 1993.** Rondorf, D.W.; Tiffan, K.F. National Biological Survey, Cook, WA (United States). Columbia River Research Lab. Dec 1994. 157p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI79-91BP21708. Order Number DE95014440. Source: OSTI; NTIS; GPO Dep.

Recovery efforts for the endangered fall chinook salmon necessitates knowledge of the factors limiting the various life history stages. This study attempts to identify those physical and biological fctors which affect spawning of the fish in the free-flowing Snake River and their rearing seward migration through Columbia River basin reservoirs. The spawning was generally a November event in 1993, with some activity in late Oct. and early Dec. Spawning habitat availability was assessed by applying hydraulic and habitat models to known fall chinook salmon spawning sites. Juveniles were seined and PIT tagged in the free-flowing Snake River, and in the Columbia River in he Hanford Reach and in McNary Reservoir. Subyearling fish were marked at McNary Dam to relate river flow and migration patterns of juveniles to adult returns. Hydroacoustic surveys were conducted on McNary and John Day reservoirs and in net pens.

24627 (DOE/BP/92818–4) **Migratory behavior of adult spring chinook salmon in the Willamette River and its tributaries.** Schreck, C.B.; Snelling, J.C.; Ewing, R.E.; Bradford, C.S.; Davis, L.E.; Slater, C.H. Oregon State Univ., Corvallis, OR (United States). Dept. of Fisheries and Wildlife. Jan 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-88BP92818. Order Number DE95014442. Source: OSTI; NTIS; GPO Dep.

Migration patterns of adult spring chinook salmon above Willamette Falls differed depending on when the fish passed the Falls, with considerable among-fish variability. Early-run fish often terminated their migration for extended periods of time, in association with increased flows and decreased temperatures. Mid-run fish tended to migrate steadily upstream at a rate of 30-40 km/day. Late-run fish frequently ceased migrating or fell back downstream after migrating 10-200 km up the Willamette River or its tributaries; this appeared to be associated with warming water during summer and resulted in considerable mortality. Up to 40% of the adult salmon entering the Willamette River System above Willamette Falls (i.e. counted at the ladder) may die before reaching upriver spawning areas. Up to 10% of the fish passing up over Willamette Falls may fall-back below the Falls; some migrate to the Columbia River or lower Willamette River tributaries. If rearing conditions at hatcheries affect timing of adult returns because of different juvenile development rates and improper timing of smolt releases, then differential mortality in the freshwater segment of the adult migrations may confound interpretation of studies evaluating rearing practices.

24628 (DOE/ER/60376–T4) **Shelf export of particulates/transport in continental margin waters. Final report.** Pietrafesa, L.J. North Carolina State Univ., Raleigh, NC (United States). Dept. of Marine, Earth and Atmospheric Sciences. [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-85ER60376. Order Number DE95014741. Source: OSTI; NTIS; GPO Dep.

During the present funding period, research activities at NCSU have been directed towards: publishing the results of SEEP-I; publishing further results from NCSU's South Atlantic Bight studies; designing and constructing four cages which house the 3 NCSU and 1 BNL RD-Acoustic Doppler Current Profilers used successfully in SEEP-II, calibrating all current meters, transmissometers, thermister chains and conductivity pressure and temperature sensors for SEEP-II phases 2 and 3; determining the temporal and spatial scales of physical processes observed during phase 1 of SEEP-II in preparation for finalizing the mooring positions and sampling intervals for SEEP-II; shipping all NCSU gear to the URI and ODU; and successful deployment of NCSU SEEP-II, phases 1 and 2 moorings.

24629 (ENEA-RT-AMB–93-11) **Membrane technologies for environmental applications.** Fabiani, C. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute). ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Oct 1993. 67p. Order Number DE95789709. Source: OSTI; NTIS (US Sales Only).

Research and development programs to improve the environmental acceptance of industrial processes are presently centered on the demonstration of new cleaner technologies. Separation unit operations based on the use of new ion exchangers, active carbons and selective membranes will play a priority role in the frame of the above strategy. A series a case histories of relevant environmental concern as the treatment of ground water polluted by nutrients, green waters, milk whey, industrial waters of the textile and metallurgical sectors are discussed. The research and development needs for new membranes suitable for the treatment of gas mixtures and gaseous emissions, are also briefly outlined.

24630 (ENEA-RT-AMB–94-01) **Hydrological studies in Orbetello lagoon.** Gorelli, V. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute). ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. May 1994. 37p. (In Italian). Order Number DE95789707. Source: OSTI; NTIS (US Sales Only).

In the Orbetello (Italy) lagoon, to estimate the amount and velocity of the sea-lagoon water exchange, ENEA (Italian Agency for New Technologies, Energy and the Environment) carried out 129 flow tests (39 in Nassa, 48 in Ansedonia and 42 in Fibbia canal), in september 1988. For each test section, regression lines flow versus difference of level between water level at current time and the level occurring when no flow arises (i.e. when flow changes from ingoing to outgoing) were carried out: under certain hypotesis (not far from the real behaviour), in fact, tide flow through any section of the canal is directly proportional to the difference of level defined before. Uncertainty in determination of flow inversion local level may generate some errors. To minimize them, data were grouped, putting in the same group those occurring in the same half-wave tide. Groups composed by only one, or two data were neglected, because linear regression analysis is impossible in the first case and not significant (since correlation is always equal to one) in the last one. In april 1993, Nassa and Ansedonia mouths were closed; pumping stations started, forcing water, through those mouths, into the lagoon from the sea: in june, steady-state was reached, with constant outgoing flow by Fibbia mouth added up to tide alternate (sine-wave) flow. This behaviour was confirmed by regression analysis of some flow tests, made in the forced flow state described before.

24631 (ENEA-RT-AMB–94-03) **Meteorological and hydrological measurements in gulf of La Spezia (Italy).** Bassano, E. (ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute); Boniforti, R.; Iacovelli, M.; Marri, P.; Pezzani, A. ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute. May 1994. 33p. (In Italian). Order Number DE95789708. Source: OSTI; NTIS (US Sales Only).

The acquisition of meteorological and hydrological data inside the gulf of La Spezia was carried on during a research program which aim was to examine the environmental conditions of the coastal water. One of the proposed aim was to acquire data about the stratification of the water column and the effects of the wind stress. In this report it is briefly described the used instruments and examine, in a qualitative way, temporal sequences of measurements of wind and temperature of air and water acquired during 1991. Data obtained during 1990 and 1992, which are available on magnetic support, will be successively described. One of the important achieved results is the average daily cycle of air and water temperature for each month.

24632 (ENEA-RT-AMB–94-04) **Water properties measurements near Sturla (Genoa, Italy) depurator.** Bassano, E. (ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute); Boniforti, R.; Iacovelli, M.; Marri, P.; Pezzani, A. ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute. May 1994. 46p. (In Italian). Order Number DE95789713. Source: OSTI; NTIS (US Sales Only).

In a study on the dispersion mechanisms of outflowing from underwater pipes conducted by ENEA (Italian Agency for New Technologies, Energy and the Environment) on behalf of the regional authority for Liguria, a monitoring system was positioned in the area in front of the depurator at Sturla (Genoa, Italy). This system, which is briefly described in the text, was on-line during 1993. The large data set, which was acquired, are useful to examine the hydrological properties and the processes of mixing and stratification of the water column which influence the dispersion of pollutants in the area. The measurements included air and water temperature, precipitation, salinity, sigma TAU, wind velocity, pH and oxygen. Data are summarized in graphs of vertical profiles and annual time series of daily averaged values.

24633 (ENEA-RT-AMB–94-06) **Temperature measurements of surface waters in La Spezia gulf.** Ferretti, E. (ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute); Lisca, A.; Marri, P.; Raso, G. ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute. Aug 1994. 41p. (In Italian). Order Number DE95789712. Source: OSTI; NTIS (US Sales Only).

This report describes the instruments used to measure in continuum the temperature of the surface water layer in the gulf of La Spezia. Furthermore, the results collected in situ during two campaigns are presented and discussed. The first campaign was carried out on 22 November 1991 to evaluate the thermal plume due to the outfall of the electrical power station working at the maximum power level. The second campaign was carried out on 19 December 1991, a week after the station was not operative and the thermal effect observed earlier was not present. Simultaneously with the in situ measurements during the first campaign, an airplane using infrared (IR) radiometer mapped the spatial distribution of the sea surface temperature in the gulf. The in situ measurements were used to calibrate the remotely sensed data.

24634 (ENEA-RT-AMB–94-16) **Effects of industrial activities on physical and chemical characteristics of water of La Spezia Harbour (Italy).** Baldi, A. (ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute); Bassano, E.; Jacovelli, M.; Marri, P.; Pezzani, A.; Schirone, A. ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute. Jul 1994. 28p. (In Italian). Order Number DE95789740. Source: OSTI; NTIS (US Sales Only).

In cooperation with local authorities and ENEL (National Electricity Board of Italy), ENEA (National Agency for New Technologies, Energy and the Environment) is conducting a study aimed at investigating the effects of industrial activities on the physico-chemical characteristics of the water of La Spezia harbour. In this frame a monitoring system is deployed since 1989 for continuous recording of hydrological and meteorological parameters relevant to a description of the environmental quality of the marine area under investigation. In particular, this report describes the influence of the thermal discharge from the ENEL electric power station on the harbour water temperature in the period from 15 september 1992 to 15 november 1992. It also describes the effects of natural phenomena, such as the inflowing of water from the Magra river, on the reference temperature in La Spezia harbour. Data obtained by the monitoring system are summarized in graphical form as far as air temperature, water temperature, salinity and precipitation are concerned.

24635 (ENEA-RT-AMB–94-18) **Remote sensing techniques applied to archaeological research.** Vitiello, F. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute); Talice, S. ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Oct 1994. 14p. (In Italian). (CONF-9404274–1: Forma lacus antiqui conference on geoarchaeology, Bolsena (Italy), 30 Apr 1994). Order Number DE95789741. Source: OSTI; NTIS (US Sales Only).

The paper describes the airborne remote sensing techniques and their applications to the archaeological research. Since 1990 ENEA (Italian Agency for New Technologies, Energy and the Environment)-Alenia aircraft has realized some missions to evaluate the possible applications of airborne remote sensing in archaeological research; the paper shows the mission which has carried out in Napoli gulf with CZCS (coastal zone color scanner) multispectral scanner and the processing of digital imagery which allowed the identification of archaeological structures in the sea. Other activities are in progress (for example in the Bolsena Lake and in Nemi Lake) because in Italy there are many known and unknown archaeological structures.

24636 (ETDE-DE–174) **The lower Weser river in 1993.** Ministerium fuer Umwelt, Raumordnung und Landwirtschaft des Landes Nordrhein-Westfalen, Duesseldorf (Germany); Arbeitsgemeinschaft zur Reinhaltung der Weser, Duesseldorf (Germany); Senator fuer Umweltschutz und Stadtentwicklung, Bremen (Germany). Dec 1994. 83p. (In German). Order Number DE95795754. Source: OSTI; NTIS (US Sales Only).

The report starts with a historical outline of the development of the river and its region. The Weser river is a tidal river, and its special characteristics are gone into. The water quality was investigated in a river section 70 km long. Renaturation measures along the lower Weser river and its marshland have been discussed for a long time. The present state of discussion is outlined at the end of the report.

24637 (FZKA–5549) **Enrichment and identification of polar and nonpolar nitrogen compounds with low molecular masses in effluents of municipal sewage clarification plants with secondary treatment.** Grohmann, K. Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Inst. fuer Technische Chemie; Karlsruhe Univ. (T.H.) (Germany). Fakultaet fuer Chemie. Feb 1995. 149p. (In German). Order Number DE95790241. Source: OSTI; NTIS (US Sales Only).

It is proposed in this report to contribute to elucidating about 99% unknown organic nitrogen compounds present as Dissolved Organic Nitrogen (DON) in a sewage clarification plant. For this, an enriching method based on reversed phases was developed as a first step which, following enrichment by the factor 5000, allows reproducible recovery up to 99% to be achieved, at least for the nitrogen compounds metered in. Considering possible losses due to adsorption on the vessel materials and on sample constituents, the experimental conditions must be very strictly observed. When these methods were applied to untreated and membrane filtered samples, effects were observed which suggest that the compounds investigated are associated with other sample constituents. This called for a new definition of the fractions obtained by membrane filtration. In the second part of the report a screen is elaborated which, after application of the PBM algorithm to the GC/MS spectra obtained in the analysis of true samples, allows an evaluated statement to be made on the organic compound present. Consequently, an at last 30% agreement indicates that a nitrogen containing compound can be supposed. The elaborated enrichment and evaluation methods were applied and ten samples processed with concentration factors of 1000-20.000 which yielded 133 different nitrogen compounds, with an probability of occurence of at least 30% put out. (orig./SR)

24638 (INIS-mf–14542) **Preliminary report in radiological safety for 1993 hydrology campaign.** Badano, A. (Nuclear Technology National Direction, Montevideo (Uruguay)); Suraez, R.; Dellepere, A.; Barreiro, M. Ministerio de Industria, Energia y Mineria, Montevideo (Uruguay). Direccion Nacional de Tecnologia Nuclear. [1993]. 12p. (In Spanish). Order Number DE95632316. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of this report is to provide a study about industrial effluents influence on water pollution of Montevideo coastal beaches. The methods which have been considered are nuclear tracer techniques with a special attention in the radioprotection supervision. Three points are considered as evaluation: handling of radioactive tracers and safety, radiation protection workers, environment and public safety. tabs.

24639 (PNL–10627) **Ecological evaluation of proposed dredged material from Richmond Harbor Deepening Project and the Intensive study of the Turning Basin.** Pinza, M.R. (Battelle/Marine Sciences Lab., Sequim, WA (United States)); Mayhew, H.L.; Karle, L.M.; Kohn, N.P.; White, P.J.; Word, J.Q.; Michaels, L.L. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 660p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015196. Source: OSTI; NTIS; GPO Dep.

Richmond Harbor is on the eastern shoreline of central San Francisco Bay and its access channels and several of the shipping berths are no longer wide or deep enough to accommodate modern deeper-draft vessels. The Water Resources Development Act of 1986 (PL99-662) authorized the US Army Corps of Engineers (USACE), San Francisco District to deepen and widen the navigation channels in Richmond Harbor. Several options for disposal of the material from this dredging project are under consideration by USACE: disposal within San Francisco Bay, at open-ocean disposal sites, or at uplands disposal sites. Purpose of this study was to conduct comprehensive evaluations, including chemical, biological, and bioaccumulation testing of sediments in selected areas of Richmond Harbor. This information was required by the Environmental Protection Agency (EPA) and USACE. Battelle/Marine Sciences Laboratory collected 20 core samples, both 4-in. and 12-in., to a project depth of -40 ft mean lower low water (MLLW) (-38 ft MLLW plus 2 ft of overdepth) using a vibratory-hammer core. These 20 field samples were combined to form five test composites plus an older bay mud (OBM) composite that were analyzed for physical/chemical parameters, biological toxicity, and tissue chemistry. Solid-phase tests were conducted with the amphipod, Rhepoxynius abronius; the clam, Macoma nasuta; and the polychaete worm, Nephtys caecoides. Suspended-particulate-phase (SPP) tests were conducted with the sanddab, Citharichthys stigmaeus; the mysid, Holmesimysis costata; and the bivalve, Mytilus galloprovincialis. Bioaccumulation of contaminants was measured in tissues of Macoma nasuta and Nereis virens. Sediments from one ocean reference sediment, and two in-bay reference sediments, were tested concurrently. Results from analysis of the five test treatments were statistically compared with the reference sediment R-OS in the first five sections of this report.

24640 (UCRL-ID–118533) **Pencil beam radar selectivity of ocean wave spectra.** Manasse, R. Lawrence Livermore National Lab., CA (United States). 1 Aug 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015379. Source: OSTI; NTIS; GPO Dep.

Over the past several years some very interesting data relevant to ocean wave backscatter have been produced by non scanning pencil beam radars with high range resolution. These radars are located-on land which overlooks the water/sea surface and operate at low grazing angles (LGA). Prominent among these are the X-band RSRE-Thorn EMI and the LLNL-Hughes real aperture radars employed in the Joint US/UK ocean wave experiments in Loch Linnhe and the Sound of Sleat (Scotland). The range-time image obtained with the RSRE radar is typical of the many images which have been obtained. The most prominent features of these images are linear regions or strips of increased average RCS having temporal durations up to or exceeding 100 seconds. For HH polarization these features are marked by the presence of periodic spikes in RCS. The features appear quite consistent with wave groups which are moving approximately parallel to the radar boresight. A self-consistent model of this wave group behavior, as manifested in the radar images, has been proposed by Tulin. This model provides estimates of the wavelengths involved and accounts for the periodicity of the spiky returns which appear to be due to the passage of nonlinear or incipiently breaking waves through the wave groups. Nothing in this model precludes the presence of multiple wave groups moving at different velocities. In fact, some images exhibit wave groups moving at different velocities, and in some cases both incoming and outgoing wavegroups

are present simultaneously. Obviously, X-band Bragg waves cannot explain these features because the lifetime of these waves is, at best, a few seconds. The association of these features with the scattering from the crests of much larger (e.g., meters) waves is reasonable because the lifetime of these waves is very long. However, it is not reasonable to assume that ambient wavegroups in the field of view of the radar all just happen to be moving along the radar boresight.

This volume contains abstracts of oral and poster presentations made at the LIX Cold Springs Harbor Symposium on Quantitative Biology held June 1–8, 1994.

24643 (CONF-950587–1) **The effect of biotin on the production of succinic acid by Anaerobiospirillum succiniciproducens.** Nghiem, N.P. (and others); Davison, B.H.; Thompson, J.E. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 17. symposium on biotechnology for fuels and chemicals; Vail, CO (United States); 7-11 May 1995. Order Number DE95013991. Source: OSTI; NTIS; GPO Dep.

Succinic acid is an intermediate of the tricarboxylic acid (TCA) cycle, and therefore, is found in almost all plant and animal cells, albeit at very low concentrations. It has a very wide usage range, which includes applications in agriculture, food, medicine, plastics, cosmetics, textiles, plating and waste-gas scrubbing. Succinic acid currently is produced commercially by chemical processes. A fermentation process for its production is of great interest because in such process, renewable resources such as corn-derived glucose can be used as starting material. There is not a current biological process for the commercial production of succinic acid. Extensive efforts have been devoted to the isolation and screening of succinic acid-producing microorganisms. The anaerobic bacterium, Anaerobiospirillum succiniciproducens, is considered among the best direct succinic acid producers. A number of patents concerning the production of succinic acid by this organism have been issued. Our first attempt to develop a biological process for the production of succinic acid by A. succiniciproducens involved fermentation media improvement, in particular the use of supplemented nutrients. In this note, we show that higher yield of succinic acid could be achieved by supplementing the fermentation media with biotin, as a potential nutrient supplement representative.

24644 (DOE/ER/13970–T2) **[CarbBank and the complex carbohydrate structure database. Annual report 1994].** Albersheim, P.; Doubet, S. Georgia Univ., Athens, GA (United States). Complex Carbohydrate Research Center. 21 Apr 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-88ER13970. Order Number DE95012192. Source: OSTI; NTIS; GPO Dep.

A brief status report and forthcoming changes to the CarbBank, a carbohydrate database, is provided.

A brief overview of the CarbBank, a carbohydrate database, is provided.

24646 (DOE/ER/14071–4) **Molecular biology of Lea genes of higher plants. Progress report.** Dure, L.S. III. Georgia Univ., Athens, GA (United States). Research Foundation. 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-89ER14071. Order Number DE95014343. Source: OSTI; NTIS; GPO Dep.

Annual progress report discusses achievements on the elucidation of the function of the D-7 Lea proteins. Studies aimed at the immunoassay, fractionation, and molecular modeling are described.

24647 (DOE/ER/20034–2) **Regulation of polyamine synthesis in plants. Annual progress report, July 1, 1992–June 30, 1993.** Malmberg, R.L. Georgia Univ., Athens, GA (United States). Dept. of Botany. [1995]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-91ER20034. Order Number DE95015430. Source: OSTI; NTIS; GPO Dep.

After isolation of a cDNA clone for the plant ARGdc, this research focused on unusual post-translational modifications occuring in a arginine decarboxylase cDNA clone in oats. A novel regulatory mechanism for polyamines was explored and an attempt was made to characterize it. A plant ornithine decarboxylase cDNA was identified in Arabidopsis. Further work remains on the mechanisms of polyamine regulation and function in plants.

24648 (DOE/ER/20034–3) **Regulation of polyamine synthesis in plants. Final progress report, July 1, 1991–December 31, 1994.** Malmberg, R.L. Georgia Univ., Athens, GA (United States). Dept. of Botany. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-91ER20034. Order Number DE95015429. Source: OSTI; NTIS; GPO Dep.

This research focused on unusual post-translational modifications occuring in a arginine decarboxylase cDNA clone in oats. A novel regulatory mechanism for polyamines was explored and an attempt was made to characterize it. A plant ornithine decarboxylase cDNA was identified in Arabidopsis. Further work remains on the mechanisms of polyamine regulation and function in plants.

24649 (DOE/ER/25212–T1) **Workshop on algorithms for macromolecular modeling. Final project report, June 1, 1994–May 31, 1995.** Leimkuhler, B.; Hermans, J.; Skeel, R.D. Kansas Univ., Lawrence, KS (United States). [1995]. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-94ER25212. Order Number DE95015463. Source: OSTI; NTIS; GPO Dep.

A workshop was held on algorithms and parallel implementations for macromolecular dynamics, protein folding, and structural refinement. This document contains abstracts and brief reports from that workshop.

24650 (DOE/ER/61040–3) **Characterization of the mammalian DNA polymerase gene(s) and enzyme(s). Annual progress report.** Mishra, N.C. South Carolina Univ., Columbia, SC (United States). Dept. of Biological Sciences. Jan 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-90ER61040. Order Number DE95016134. Source: OSTI; NTIS; GPO Dep.

Consistent with the long term goal of our research to understand the nature of the key enzymes in eukaryotic DNA replication we have characterized the properties of the wild type DNA polymerases of the α-family and their mutants. We have also provided evidence for the role of aphidicolin in the elongation process of the in vivo DNA replication in eukaryotic cells. We also developed a technology for planned prep from a large numbers of clones for direct screening by size or restriction digestion in order to facilitate our goals to clone the DNA polymerase gene.

24651 (DOE/ER/61040–4) **Characterization of the mammalian DNA polymerase gene(s) and enzyme(s). Annual progress report.** Mishra, N.C. South Carolina Univ., Columbia, SC (United States). Jan 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-90ER61040. Order Number DE95016135. Source: OSTI; NTIS; GPO Dep.

Two Genes for DNA polymerase delta were identified from the wild type Chinese hamster ovary cells. These genes were cloned via RT-PCR from mRNA prepared the Chinese hamster ovary cells using primers specific to conserved sequences of the DNA polymerase δ gene. The first gene encodes a PCNA dependent DNA polymerase δ gene whereas the second gene encodes a PCNA independent DNA polymerase δ gene. Methods were developed to clone these genes in expression vector and host systems. The role of the two genes in DNA replication and repair was determined.

24652 (DOE/ER/61040–T1) **Characterization of the mammalian DNA polymerase gene and protein. Annual progress report.** Mishra, N.C. South Carolina Univ., Columbia, SC (United States). Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-90ER61040. Order Number DE95016136. Source: OSTI; NTIS; GPO Dep.

Methods were developed to purify the DNA polymerases of the α-family from Chinese hamster cells and their mutants selected as resistant to aphidicolin or specific inhibitor of DNA polymerases of the α-family. The wild type and mutant DNA polymerases were characterized with respect to their biochemical properties. A methodology was also developed to identify the replication intermediates and aphidicolin was found to inhibit a replication intermediate of the 24Kb size indicating the fact that aphidicolin inhibits the elongation process during DNA replication. This is the first demonstration of such role of aphidicolin in the eukaryotic DNA replication.

24653 (ETDE-DE–154) **Analysis of bioengineering research and development structures and potentials in Baden-Wuerttemberg. Final report.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 40. Jaeckel, G. (Fraunhofer-Institut fuer Systemtechnik und Innovationsforschung (ISI), Karlsruhe (Germany)); Huesing, B.; Strauss, E.; Reiss, T. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany); Fraunhofer-Institut fuer Systemtechnik und Innovationsforschung (ISI), Karlsruhe (Germany). Dec 1994. 107p. (In German). Order Number DE95790379. Source: OSTI; NTIS (US Sales Only).

The future trends in research activities of the industry, universities and other research institutions in Baden-Wuerttemberg are established on the basis of a written inquiry. Enterprises in biotechnology were also asked about their structure, staff, cooperation projects, and infrastructure. The findings are discussed in interviews with selected biotechnology enterprises. (orig.)

24654 (LA–12893-C, pp. 1-11) **Isotope labeling for NMR studies of macromolecular structure and interactions.** Wright, P.E. (Scripps Research Institute, La Jolla, CA (United States)). Los Alamos National Lab., NM (United States). Dec 1994. Grant GM36643; Grant CA27498. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Implementation of biosynthetic methods for uniform or specific isotope labeling of proteins, coupled with the recent development of powerful heteronuclear multidimensional NMR methods, has led to a dramatic increase in the size and complexity of macromolecular systems that are now amenable to NMR structural analysis. In recent years, a new technology has emerged that combines uniform ^{13}C, ^{15}N labeling with heteronuclear multidimensional NMR methods to allow NMR structural studies of systems approaching 25 to 30 kDa in molecular weight. In addition, with the introduction of specific ^{13}C and ^{15}N labels into ligands, meaningful NMR studies of complexes of even higher molecular weight have become feasible. These advances usher in a new era in which the earlier, rather stringent molecular weight limitations have been greatly surpassed and NMR can begin to address many central biological problems that involve macromolecular structure, dynamics, and interactions.

Dioxygen is an ideally suited substrate for enzymatic manipulation in oxidation-reduction chemistry and in substrate transformation. It is a powerful oxidant with a midpoint potential of 0.815 at neutral pH; at the same time, however, it exists in a triplet state in its most stable electronic configuration. This latter property confers kinetic inertness as a result of spin-conservation restrictions on reaction chemistry. If these restrictions can be overcome and controlled, dioxygen's high redox potential can be used to maximize efficiency in free-energy conversion processes and to effect activation of relatively inert substrates.

24656 (LA–12893-C, pp. 27-42) **Use of specifically ^{15}N-labeled histidine to study structures and mechanisms within the active sites of serine proteinases.** Bachovchin, W.W. (Tufts Univ. The current emphasis in biological NMR work is on determining structures of biological macromolecules in solution. This emphasis is appropriate because NMR is the only technique capable of providing high-resolution structures that are comparable to those of x-ray crystallography for molecules in solution. This structural knowledge is immensely valuable and is needed in many areas of investigation. However, as valuable as such structural knowledge is, it never provides all the answers; a structure often reveals more questions than answers.

biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs. 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

To understand the details of macromolecular function, high-resolution structural and dynamic detail is essential. The polypeptide fold of the gramicidin channel has been effectively modeled for the past 20 years, yet the functional changes in conductance and channel lifetime associated with amino acid substitutions cannot be predicted. To accomplish this goal, high-resolution electrostatic modeling and the precise orientation of all dipoles are required. Furthermore, an enhanced knowledge of the complex molecular environment of this membrane-bound peptide is needed. An aqueous environment is relatively uniform and achiral. The membrane environment is very heterogenous and chiral. A knowledge of the interactions, specific and nonspecific, between peptide and lipid will aid in developing a better understanding of this environment. To accomplish this goal, it is necessary to study the peptide in an extended lipid bilayer, rather than in a vesicular or micellar form. These latter environments are likely to possess increased dynamics, increased water penetration, and distorted interactions between the polypeptide and membrane surface. To perform NMR studies on bilayer bound peptides, solid state NMR methods are required, and for specific site information, isotopic labels are incorporated using solid phase peptide synthesis.

24658 (LA–12893-C, pp. 73-86) **Isotopic chirality.** Floss, H.G. (Univ. of Washington, Seattle, WA (United States)). Los Alamos National Lab., NM (United States). Dec 1994. This paper deals with compounds that are chiral-at least in part, due to isotope substitution-and their use in tracing the steric course of enzyme reaction in vitro and in vivo. There are other applications of isotopically chiral compounds (for example, in analyzing the steric course of nonenzymatic reactions and in probing the conformation of biomolecules) that are important but they will not be discussed in this context.

24659 (LA–12893-C, pp. 87-103) **Structures of larger proteins in solution: Three- and four-dimensional heteronuclear NMR spectroscopy.** Gronenborn, A.M. (National Institutes of Health, Bethesda, MD (United States)); Clore, G.M. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). Complete understanding of a protein's function and mechanism of action can only be achieved with a knowledge of its three-dimensional structure at atomic resolution. At present, there are two methods available for determining such structures. The first method, which has been established for many years, is x-ray diffraction of protein single crystals. The second method has blossomed only in the last 5 years and is based on the application of nuclear magnetic resonance (NMR) spectroscopy to proteins in solution. This review paper describes three- and four-dimensional NMR methods applied to protein structure determination and was adapted from Clore and Gronenborn. The review focuses on the underlying principals and practice of multidimensional NMR and the structural information obtained.

24660 (LA–12893-C, pp. 157-169) **Selective ^{2}H and ^{13}C labeling in NMR analysis of solution protein structure and dynamics.** LeMaster, D.M. (Northwestern Univ., Evanston, IL (United States)). Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Preparation of samples bearing combined isotope enrichment patterns has played a central role in the recent advances in NMR analysis of proteins in solution. In particular, uniform ^{13}C, ^{15}N enrichment has made it possible to apply heteronuclear multidimensional correlation experiments for the mainchain assignments of proteins larger than 30 KDa. In contrast, selective labeling approaches can offer advantages in terms of the directedness of the information provided, such as chirality and residue type assignments, as well as through enhancements in resolution and sensitivity that result from editing the spectral complexity, the relaxation pathways and the scalar coupling networks. In addition, the combination of selective ^{13}C and ^{2}H enrichment can greatly facilitate the determination of heteronuclear relaxation behavior.

24661 (LA–12893-C, pp. 171-188) **Magnetic resonance studies of isotopically labeled paramagnetic proteins: (2FE-2S) ferredoxins.** Cheng, H. Recent developments in NMR spectroscopy, especially multidimensional, multinuclear NMR techniques, have made NMR the most versatile tool available for studying protein structure and function in solution. Unlike diamagnetic proteins, paramagnetic proteins contain centers with unpaired electrons. These unpaired electrons interact with magnetic nuclei either through chemical bonds by a contact mechanism or through space by a pseudocontact mechanism. Such interactions make the acquisition and analysis of NMR spectra of paramagnetic proteins more challenging than those of diamagnetic proteins. Some NMR signals from paramagnetic proteins are shifted outside the chemical shift region characteristic of diamagnetic proteins; these "hyperfine-shifted" resonances originate from nuclei that interact with unpaired electrons from the paramagnetic center. The large chemical shift dispersion in spectra of paramagnetic proteins makes it difficult to excite the entire spectral window and leads to distortions in the baseline. Interactions with paramagnetic centers shorten T_1 and T_2 relaxation times of nuclei; the consequences are line broadening and lower spectral sensitivity. Scalar (through bond) and dipolar (through space) interactions between pairs of nuclei are what give rise to crosspeak signals in multi-dimensional NMR spectra of small diamagnetic proteins. When such interactions involve a nucleus that is strongly relaxed by interaction with a paramagnetic center, specialized methods may be needed for its detection or it may be completely undetectable by present nD NMR methods.

24662 (LA–12893-C, pp. 197-207) **REDOR NMR of stable-isotope-labeled protein binding sites.** Schaefer, J. (Washington Univ., St. Louis, MO (United States)). Los Alamos National Lab., NM (United States). Dec 1994. Grant NIH 40634. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Rotational-echo, double resonance (REDOR) NMR, a new analytical spectroscopic technique for solids spinning at the magic angle, has been developed over the last 5 years. REDOR provides a direct measure of heteronuclear dipolar coupling between isolated pairs of labeled nuclei. In a solid with a ^{13}C-^{15}N labeled pair, for example, the ^{13}C rotational echoes that form each rotor period following a ^{1}H-^{13}C cross-polarization transfer can be prevented

from reaching full intensity by insertion of a ^{15}N π pulse each half rotor period. The REDOR difference (the difference between a ^{13}C NMR spectrum obtained under these conditions and one obtained with no ^{15}N π pulses) has a strong dependence on the ^{13}C-^{15}N dipolar coupling, and hence, the ^{13}C-^{15}N internuclear distance. REDOR is described as double-resonance even though three radio frequencies (typically ^{1}H, ^{13}C, and ^{15}N) are used because the protons are removed from the important evolution part of the experiment by resonant decoupling. The dephasing of magnetization in REDOR arises from a local dipolar ^{13}C-^{15}N field gradient and involves no polarization transfer. REDOR has no dependence on ^{13}C or ^{15}N chemical-shift tensors and does not require resolution of a ^{13}C-^{15}N coupling in the chemical-shift dimension.

A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Carbohydrates play important roles in many key biochemical processes in living cells. For example, they are metabolized to produce energy, mediate cell-cell recognition, and play an indirect role (as constituents of DNA and RNA) in DNA replication, RNA transcription, and protein synthesis. These roles, and others of comparable biochemical significance, have been studied to varying extends with the use of stable isotopically labeled molecules, usually in conjunction with NMR spectroscopy and/or mass spectrometry. For example, carbohydrate metabolism has been monitored in vitro and in vivo with the use of isotopically labeled compounds. Molecular aspects of cell-cell recognition, mediated by cell-surface glycoproteins and glycolipids, have been probed through NMR studies of isotopically labeled oligosaccharides. More recently, the solution behavior of DNA and RNA has been examined through the use of labeled oligonucleotides. In all of these pursuits, the effort and expense to prepare labeled molecules, both of which can be substantial, are more than offset by the wealth of information derived from these studies. This information often cannot be accessed, or can be accessed only with great difficulty, using natural (unlabeled) compounds.

24664 (LA–12893-C, pp. 263-279) **Neutron scattering with deuterium labeling reveals the nature of complexes formed by Ca^{2+}-binding proteins and their regulatory targets.** Trewhella, J. (Los Alamos National Laboratory, NM (United States)). Los Alamos National Lab., NM (United States). Dec 1994. Grant GM40528; Grant DMR-9122444. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Small-angle neutron scattering with deuterium labeling is extremely useful for studying the structures of complex biomolecular assemblies in solution. The different neutron scattering properties of their isotopes of hydrogen combines with the ability to uniformly label biomolecules with deuterium allow one to characterize the structures and relative dispositions of the individual components of an assembly using methods of "contrast variation." We have applied these techniques to studies of the evolutionarily related dumbbell-shaped Ca^{2+}-binding proteins calmodulin and troponin C and their interactions with the target proteins whose activities they regulate. Ca^{2+} is one of the simplest of nature's messengers used in the communication pathways between physiological stimulus and cellular response. The signaling mechanism generally involves Ca^{2+} binding to a protein and inducing a conformational change that transmits a signal to modify the activity of a specific target protein. Ca^{2+} is thus important in the regulation of a diverse array of intracellular responses, including neurotransmitter release, muscle contraction, the degradation of glycogen to glucose to generate energy, microtubule assembly, membrane phosphorylation, etc. It is the conformational language of the Ca^{2+} induced signal transduction that we have sought to understand because of its central importance to biochemical regulation and, hence, to healthy cellular function.

24665 (LA–12893-C, pp. 281-291) **Stereoselective synthesis of stable-isotope-labeled amino acids.** Unkefer, C.J. (Los Alamos National Laboratory, NM (United States)); Martinez, R.A.; Silks, L.A. III; Lodwig, S.N. Los Alamos National Lab., NM (United States). Dec 1994. For magnetic resonance and vibrational spectroscopies to reach their full potential, they must be used in combination with sophisticated site-specific stable isotope labeling of biological macromolecules. Labeled amino acids are required for the study of the structure and function of enzymes and proteins. Because there are 20 common amino acids, each with its own distinguishing chemistry, they remain a synthetic challenge. The Oppolzer chiral auxiliary provides a general tool with which to approach the synthesis of labeled amino acids. By using the Oppolzer auxiliary, amino acids can be constructed from several small molecules, which is ideal for stable isotope labeling. In addition to directing the stereochemistry at the α-carbon, the camphorsultam can be used for stereo-specific isotope labeling at prochiral centers in amino acids. By using the camphorsultam auxiliary we have the potential to synthesize virtually any isotopomer of all of the common amino acids.

We have demonstrated that TRIR in the amide I region gives structural information regarding protein conformational changes in realtime, both on processes involved in the development of the functional structure (protein folding) and on protein structural changes that accompany the functional dynamics of the native structure. Assignment of many of the amide I peaks to specific amide or sidechain structures will require much additional effort. Specifically, the congestion and complexity of the protein vibrational spectra dictate that isotope studies are an absolute requirement for more than a qualitative notion of the structural interpretation of these measurements. It is clear, however, that enormous potential exists for elucidating structural relaxation dynamics and energetics with a high degree of structural specificity using this approach.

24667 (LA–12893-C, pp. 325-329) **Peptides and proteins.** Bachovchin, W.W.; Unkefer, C.J. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Advances in magnetic resonance and vibrational spectroscopy make it possible to derive detailed structural information about biomolecular structures in solution. These techniques are critically dependent on the availability of labeled compounds. For example, NMR techniques used today to derive peptide and protein structures require uniformity ^{13}C-and ^{15}N-labeled samples that are derived biosynthetically from (U-6-^{13}C) glucose. These experiments

are possible now because, during the 1970s, the National Stable Isotope Resource developed algal methods for producing (U-6-^{13}C) glucose. If NMR techniques are to be used to study larger proteins, we will need sophisticated labelling patterns in amino acids that employ a combination of ^{2}H, ^{13}C, and ^{15}N labeling. The availability of these specifically labeled amino acids requires a renewed investment in new methods for chemical synthesis of labeled amino acids. The development of new magnetic resonance or vibrational techniques to elucidate biomolecular structure will be seriously impeded if we do not see rapid progress in labeling technology. Investment in labeling chemistry is as important as investment in the development of advanced spectroscopic tools.

24668 (LA–12893-C, pp. 331-334) **Carbohydrates/nucleosides/RNA-DNA-ligand interactions.** Kaptein, R.; McConnell, B.; Serianni, A.S.; Silks, L.A. III. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). Carbohydrate and nucleotide structural determination using modern spectroscopic techniques is dependent on our ability to label oligonucleotides and oligosaccharides with stable isotopes. Uniform Carbon 13 and Nitrogen 15 labeling of oligonucleotides is important to present-day efforts, which are focused on determining the structure of relatively small oligosaccharides and oligonucleotides, which form the elements of larger structures. Because of the relatively recent interest in three-dimensional structure, the development of techniques used to label them has lagged behind parallel techniques used to label peptides and proteins. Therefore, this group's discussion focused primarily on problems faced today in obtaining oligonucleotides labeled uniformly with carbon 13 and nitrogen 15.

24669 (LA–12893-C, pp. 338) **Conformational study of C8 diazocine turn mimics using $^{3}J_{CH}$ coupling constants with ^{13}C in natural abundance.** Bean, J.W. (SmithKline Beecham Pharmaceuticals, King of Prussia, PA (United States)); Briand, J.; Burgess, J.L.; Callahan, J.F. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

The conformations of two diazocine turn mimics, which were later incorporated into GPIIb/IIIa peptide antagonists, were investigated using nuclear magnetic resonance techniques. The two compounds, methyl (2,5-dioxo-3-(S)-(3-ω-tosylguanidino-propyl)-4-methyl-octahydro-1,4-dazocin-1-yl)a (1) and methyl (2,5-dioxo-3-(S)-(3-ω-tosyl-guanidino-propyl)-octahydro-1,5-diazocin-1-yl)acetate (2), differ only in their substituent at the diazocine position 4 nitrogen, yet this substitution results in a marked difference in the affinity of the resulting analogs for the GPIIb/IIIa receptor. It was of interest to determine if the difference observed in the antagonistic potency between these analogs was related to constitutional or, perhaps, conformational differences. The backbone conformations of these two molecules can be determined by measuring vicinal coupling constants along the trimethylene portion of the C8 ring backbone and by measuring interproton NOE intensities between the diazocine methine proton and the protons of the trimethylene group. For compound 1, $^{3}J_{HH}$ values measured from a P.E.COSY spectrum and interproton distances calculated from ROESY buildup curves indicated the presence of a single C8 ring backbone conformation where the trimethylene bridge adopted a staggered conformation and the Hα1 and Hγ1 protons of the trimethylene group were 2.2 A from the methine proton. For compound 2, however, partial overlap of the central Hβ1 and Hβ2 protons made it impossible to measure $^{3}J_{HH}$ values from the P.E.COSY spectrum. We therefore used a ^{13}C-filtered TOCSY experiment to measure the $^{3}J_{CH}$ values in both compounds 1 and 2. These heteronuclear vicinal coupling constants measured with ^{13}C in natural abundance in conjunction with measured interproton NOE intensities indicate that these compounds share a common C8 ring backbone conformation.

24670 (LA–12893-C, pp. 340) **Sequence-specific ^{1}H, ^{13}C, and ^{15}N resonance assignments for intestinal fatty-acid-binding protein complexed with palmitate (15.4 kDa).** Hodsdon, M.E. (Washington Univ. School of Medicine, St. Louis, MO (United States)); Toner, J.J.; Cistola, D.P. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Intestinal fatty-acid-binding protein (I-FABP) belongs to a family of soluble, cytoplasmic proteins that are thought to function in the intracellular transport and trafficking of polar lipids. Individual members of this protein family have distinct specificities and affinities for fatty acids, cholesterol, bile salts, and retinoids. We are comparing several retinol- and fatty-acid-binding proteins from intestine in order to define the factors that control molecular recognition in this family of proteins. We have established sequential resonance assignments for uniformly ^{13}C/^{15}N-enriched I-FABP complexed with perdeuterated palmitate at pH7.2 and 37°C. The assignment strategy was similar to that introduced for calmodulin. We employed seven three-dimensional NMR experiments to establish scalar couplings between backbone and sidechain atoms. Backbone atoms were correlated using triple-resonance HNCO, HNCA, TOCSY-HMQC, HCACO, and HCA(CO)N experiments. Sidechain atoms were correlated using CC-TOCSY, HCCH-TOCSY, and TOCSY-HMQC. The correlations of peaks between three-dimensional spectra were established in a computer-assisted manner using NMR COMPASS (Molecular Simulations, Inc.) Using this approach, ^{1}H, ^{13}C, and ^{15}N resonance assignments have been established for 120 of the 131 residues of I-FABP. For 18 residues, amide ^{1}H and ^{15}N resonances were unobservable, apparently because of the rapid exchange of amide protons with bulk water at pH 7.2. The missing amide protons correspond to distinct amino acid patterns in the protein sequence, which will be discussed. During the assignment process, several sources of ambiguity in spin correlations were observed. To overcome this ambiguity, the additional interresidue correlations often observed in the HNCA experiment were used as cross-checks for the sequential backbone assignments.

24671 (LA–12893-C, pp. 341) **Biosynthetic incorporation of telluromethionine into dihydrofolate reductase and crystallographic analysis of the distribution of tellurium atoms in the protein molecule.** Kunkle, M.G. (Univ. of South Carolina, Columbia, SC (United States)); Lewinski, K.; Boles, J.O.; Dunlap, R.B.; Odom, J.D.; Lebioda, L. Los Alamos National Lab., NM (United States). Dec 1994. Grant GM 342907. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Recent successes in crystallographic studies of proteins with methionine (Met) residues replaced with SeMet, pioneered by Hendrickson and coworkers, inspired us to replace Met with TeMet in Escherichia coli dihydrofolate reductase (DHFR). E. coli DHFR, which catalyzes the NADPH-dependent reduction of dihydrofolate to tetrahydrofolate, consists of 159 residues, 5 of which are Met. TeMet was incorporated into DHFR using the Met auxotroph, E. coli DL41, carrying the expression vector pWT8 with an IPTG inducible promoter and ampicillin resistance gene. The enzyme was purified by successive chromatography on Q-Sepharose and PHenyl Sepharose resins, yielding milligram quantities of homogeneous enzyme with a specific activity of 40 units/mg. TeMet DHFR exhibits kinetic properties similar to those of wt DHFR. Amino acid analysis indicated 3 authentic Met residues in TeMet DHFR, whereas atomic absorption spectroscopy detected 2 Te per protein

molecule. Amino acid sequence analysis results suggested that only authentic Met was present in the first three Met positions (1,16,and 20). Crystals of Te-DHFR were grown in the presence of methotrexate from PEG 4000 and were isomorphous with wt-DHFR crystals grown from ethanol. Difference Fourier maps and restrained least-squares refinement show very little, if any, Te in the first three Met positions: Met^1, Met^{16}, and Met^{20}, whereas the occupancy of Te in positions 42 and 92 is 0.64. Apparently, the process of folding, subsequent purification, and crystallization select DHFR molecules with Te in Met^{42} and Met^{92}. Replacing Met with TeMet provides an internal probe that should facilitate structural and mechanistic studies of proteins.

24672 (LA–12893-C, pp. 342) **Stereospecific assignments of glycine in proteins by stereospecific deuteration and ^{15}N labeling.** Hansen, A.P. (Ohio State Univ., Columbus, OH (United States)); Curley, R.W. Jr.; Panigot, M.J.; Fesik, S.W. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Stereospecific assignments are important for accurately determining the three-dimensional structures of proteins through the use of multidimensional NMR techniques. It is especially important to stereospecifically assign the glycine α-protons in proteins because of the potential for different backbone conformations of this residue. These stereospecific assignments are critical for interpreting the $^3J_{NH,\alpha H}$ coupling constants and NOEs involving the glycine α-protons that determine the conformation of this part of the protein. However, it is often difficult to unambiguously obtain the stereospecific assignments for glycine residues by using only NOE data. In this poster, we present a method for unambiguous, stereospecific assignment of the α-protons of glycine residues. This method involves synthesis of stereo-specifically deuterated and ^{15}N-labeled Gly using a slightly modified procedure originally described by Woodard and coworkers for the stereoselective deuteration of glycine. The stereospecifically deuterated and ^{15}N-labeled Gy has been incorporated into recombinant proteins expressed in both bacterial systems (FKBP) and mammalian cells (u-PA). Two- and three-dimensional isotope-filtered and isotope-edited NMR experiments were used to obtain the stereospecific assignments of the glycine α-protons for these proteins.

24673 (LA–12893-C, pp. 343) **Uniform ^{15}N- and $^{15}N/^{13}C$-labeling of proteins in mammalian cells and solution structure of the amino terminal fragment of u-PA.** Hansen, A.P. (Abbott Laboratories, Abbott Park, IL (United States)); Petros, A.M.; Meadows, R.P.; Mazar, A.P.; Nettesheim, D.G.; Pederson, T.M.; Fesik, S.W. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Urokinase-type plasminogen activator (u-PA) is a 54-kDa glycoprotein that catalyzes the conversion of plasminogen to plasmin, a broad-specificity protease responsible for the degradation of fibrin clots and extracellular matrix components. The u-PA protein consists of three individual modules: a growth factor domain (GFD), a kringle, and a serine protease domain. The amino terminal fragment (ATF) includes the GFD-responsible for u-PA binding to its receptor-and the kringle domains. This protein was expressed and uniformly ^{15}N-and $^{15}N/^{13}C$-labeled in mammalian cells by methods that will be described. In addition, we present the three-dimensional structure of ATF that was derived from 1299 NOE-derived distance restraints along with the ϕ angle and hydrogen bonding restraints. Although the individual domains in the structures were highly converged, the two domains are structurally independent. The overall structures of the individual domains are very similar to the structures of homologous proteins. However, important structural differences between the growth factor domain of u-PA and other homologous proteins were observed in the region that has been implicated in binding the urokinase receptor. These results may explain, in part, why other growth factors show no appreciable affinity for the urokinase receptor.

24674 (LA–12893-C, pp. 346) **Structural studies on leukaemia inhibitory factor.** Norton, R.S. (Biomolecular Research Institute, Parville (Australia)); Maurer, T.; Smith, D.K.; Nicola, N.A. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Leukaemia Inhibitory Factor (LIF) is a pleiotropic cytokine that acts on a wide range of target cells, including mega-karyocytes, osteoblasts, hepatocytes, adipocytes, neurons, embryonic stem cells, and primordial germ cells. Many of its activities are shared with other cytokines, particularly interleukin-6, oncostatin-M, ciliary neurotrophic factor, and granulocyte colony-stimulating factor (G-CSF). Although secreted in vivo as a glycoprotein, nonglycosylated recombinant protein expressed in E. coli is fully active and has been used in our nuclear magnetic resonance (NMR) studies of the three-dimensional structure and structure-function relationships of LIF. With 180 amino acids and a molecular mass of about 20 kDa, OF is too large for direct structure determination by two-dimensional and three-dimensional ^{1}HNMR. It is necessary to label the protein with the stable isotopes ^{15}N and ^{13}C and employ heteronuclear three-dimensional NMR in order to resolve and interpret the spectral information required for three-dimensional structure determination. This work has been undertaken with both human LIF and a mouse-human chimaera that binds to the human LIF receptor with the same affinity as the human protein and yet expresses in E. coli at much higher levels. Sequence-specific resonance assignments and secondary structure elements for these proteins will be presented and progress towards determination of their three-dimensional structures described.

24675 (LA–12893-C, pp. 347) **Measurement of CO_2 and N_2O at nanomolar amounts using continuous-flow isotope-ratio mass spectrometry (CF-IRMS).** Patel, A (Univ. of Dundee (United Kingdom)); Downie, S.; Webster, E.; Hopkins, D.W.; Rennie, M.J. We are currently developing methods using Continuous Flow Isotope Ratio Mass Spectrometry (CF-IRMS) in conjunction with a thermal desorption purification unit to measure nanomolar levels of $C0_2$ and N_20. Samples of the pure gases diluted in He/air and transferred to septum capped Exetainers (Labco) provided a simple means to investigate the technique. We analyzed $C0_2$ at natural abundance in the concentration range 50 to 5 nmoles and N_20 at two concentrations between 25 and 5 nmoles. The technique was then used to measure $C0_2$ (natural abundance and ^{13}C-labeled) generated from the ninhydrin reaction. The results are summarized in a table; values are expressed in delta ^{13}C notation relative to Pee Dee Belemnite. The data show that, provided care is taken to minimize or eliminate sources of contamination (air leaks, etc.), CF-IRMS coupled with a thermal desorption unit permits measurement of ^{13}C enrichment in much smaller amounts of isolated amino acids than has been possible until now. The new methodology, including thermal desorption, should allow stable-isotope investigations on much smaller samples than are possible with other currently available techniques-while maintaining high precision.

HPr and Enzyme IIA^{Glc} are two of the components of the bacterial PTS (phosphoenolpyruvate: sugar phosphotranferase system) and are involved in the phosphorylation and concomitant translocation of sugars across the membrane. These PTS protein complexes also regulate sugar transport. HPr, phosphorylated at a histidine N1 site by Enzyme I and phosphoenol pyruvate, transfers the phosphoryl group to a histidine N3 position in Enzyme IIA^{Glc}. HPrs from Gram-positive bacteria undergo regulatory phosphorylation at Ser^{46}, whereby phosphorylation of the histidine residue is inhibited. Conversely, histidine phosphorylation inhibits phosphorylation at Ser^{46}. HPrs from Gram-negative bacteria possess a serine residue at position 46, but do not undergo regulatory phosphorylation. HPr forms an open-faced sandwich structure with a four-strand S-sheet and 2 to 3 helices lying on top of the sheet. The active-site histidine and Ser^{46} occur in conformationally flexible regions. P-His-HPr from the Gram-positive bacterium Bacillus subtilus has been investigated by both homonuclear and heteronuclear two-dimensional and three-dimensional NMR experiments using an in-situ enzymatic regeneration system to maintain a constant level of P-His-HPr. The results show that localized conformational changes occur in the vicinity of the active-site histidine and also near Ser^{46}. HPr-Enzyme IIA^{Glc} complexes from both Bacillus subtilis and Gram-negative Escherichia coli were also studied by a variety of ^{15}N-edited two-dimensional NMR experiments, which were performed on uniformly ^{15}N-labeled HPr complexed to unlabeled Enzyme IIA^{Glc}. The complex is in fast exchange with a molecular weight of about 27 kDa. The focus of our work is to assess the changes undergone by HPr (the smaller of the two components), and so all the experiments were performed with excess Enzyme IIA present in the system.

Due in part to the use of labeled glycerol for the ^{13}C enrichment of biomolecules, we are currently developing new synthetic routes to various isotopomers of glycerol. Judging from our experience, traditional methods of glycerol synthesis are not easily adapted for isotopic enrichment and/or have poor overall yields (12 to 15%). Furthermore, the use of glycerol for enrichment can be prohibitively expensive and its availability is limited by the level of demand. We are presently developing a short de novo synthesis of glycerol from carbon dioxide (~53% overall yield for four steps) and are examining the feasibility of synthesizing site-specific ^{13}C-labeled glycerol and dihydroxyacetone (DHA) from labeled methanol and carbon dioxide. One application of ^{13}C glycerol we have examined is enzymatic conversion of glycerol to glyceraldehyde-3-monophosphate or dihydroxyacetone monophosphate (DHAP) with yields ranging from 25 to 50% (as determined by NMR spectroscopy). We are also pursuing the chemical conversion of ^{13}C-labeled DHA to DHAP. We are especially interested in ^{13}C-labeled DHAP because we are investigating its use as a chemo-enzymatic precursor for both labeled 2-deoxyribose and 2-deoxyribonucleic acids.

24678 (LA–12893-C, pp. 352) **Mechanistic studies of 3-deoxy-D-manno-octulosonic acid 8-phosphate synthase.** Dotson, G.D. (Univ. of Michigan, Ann Arbor, MI (United States)); Woodard, R.W. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228--: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

The enzyme 3-deOXY-D-manno-octulosonic acid 8-phosphate synthase (KDO 8-P synthase) catalyses the condensation of arabinose 5-phosphate (A 5-P) with phosphoenolpyruvate (PEP) to give the unique eight-carbon acidic sugar 3-deoxy-D-nianno-octulosonic acid 8-phosphate (KDO 8-P) found only in gram-negative bacteria and required for lipid A maturation and cellular growth. The E. coli gene kdsA that encodes KDO 8-P synthase has been amplified by standard PCR methodologies. The synthetic gene, subcloned into the expression vector pT7-7 was used to infect E. coli BL 21 (DE 3). Purification of crude supernatant from this transformant on Q Sepharose yields >200 mg of near-homogeneous KDO 8-P synthase per liter of cell culture. To explore the mechanism of KDO 8-P synthase, we prepared (E)- and (Z)-(3-^2H)PEP, (2-^{13}C)PEP, and (2-^{13}C,^{18}O)PEP chemically from the appropriately labeled 3-bromopyruvates by reaction with trimethylphosphite under Perkow reaction conditions. Our ^1H-NMR analysis of the stereochemistry at C3 of the KDO 8-Ps, obtained by separate incubation of (E)- and (Z)-(3-^2H)PEP with A 5-P in the presence of KDO 8-P synthase, demonstrated that the reaction is stereospecific with respect to both the C3 of PEP and the C1 carbonyl of A 5-P. (Z)-(3-^2H)PEP gave predominantly (3S)-(3^2H)KDO 8-P and (E)-(3-^2H)PEP gave predominantly (3R)-(3^2H)KDO-8P, which indicates condensation of the si face of PEP upon the re face of A 5-P-an orientation analogous to that seen with the similar aldehyde lyase DAH 7-P synthase. The fate of the enolic oxygen of (2-^{13}C, ^{18}O)PEP, during the course of the KDO 8-P synthase-catalyzed reaction as monitored by both ^{13}C- and ^{31}P-NMR spectroscopy demonstrated that the inorganic phosphate (Pi) and not the KDO 8-P contained the ^{18}O.

Heteronuclear multiple-pulse-based Cross Polarization (HECP) between scalar coupled spins is gaining an important role in high-resolution multidimensional NMR of isotopically labeled biomolecules, especially in experiments involving net magnetization transfer. It has generally been observed that in these situations, the performance of HECP is superior to that of INEPT-based sequences. In particular, HECP-based three-dimensional HCCH spectroscopy is more efficient than the INEPT version of the same experiment. Differences in sensitivity have been intuitively attributed to relaxation effects and technical factors such as radiofrequency (rf) inhomogeneity We present theoretical analyses and computer simulations to probe the effects of these factors. Relaxation effects were treated phenomenologically; we found that relaxation differences are relatively small (up to 25%) between pulsed-free-precession (INEPT) and HECP-although always in favor of HECP. We explored the rf effects by employing a Gaussian distribution of rf amplitude over sample volume. We found that inhomogeneity effects significantly favor HECP over INEPT, especially under conditions of "matched " inhomogeneity in the two rf coils. The differences in favor of HECP indicate that an extension of HECP to triple resonance experiments (TRCP) in I -> S -> Q net transfers might yield better results relative to analogous INEPT-based net transfers. We theoretically analyze the possibilities of TRCP and find that transfer functions are critically dependent on the ratio J_{IS}/J_{SQ}. When J_{IS} equals J_{SQ}, we find that 100% transfer is possible for truly simultaneous TRCP and this transfer is obtained in a time 1.41 /J. The TRCP time requirement compares favorably with optimally concatenated INEPT-transfers, where net transfer I -> S -> Q is complete at 1.5 /J.

Complex DNA structures (for example, triplexes, quadruplexes, junctions) and DNA-ligand complexes are more difficult to study by NMR than standard DNA duplexes are because they have high molecular weights, show nonstandard or distorted local conformations, and exhibit large resonance linewidths and severe ^{1}H spectral overlap. These systems also tend to have limited solubility and may require specialized solution conditions to maintain favorable spectral characteristics, which adds to the spectroscopic difficulties. Furthermore, with more atoms in the system, both assignment and structure calculation become more challenging. In this article, we focus on demonstrating the current status of NMR studies of such systems and the limitations to further progress; we also indicate in what ways isotopic enrichment can be useful.

DNA fragments labeled with ^{15}N at the ring nitrogens and at the exocyclic amino groups can be used to obtain novel insight into interactions such as base pairing, hydration, drug binding, and protein binding. A number of synthetic routes to ^{15}N-labeled pyrimidine nucleosides, purines, and purine nucleosides have been reported. Moreover, many of these labeled bases or monomers have been incorporated into nucleic acids, either by chemical synthesis or by biosynthetic procedures. The focus of this chapter will be on the preparation of ^{15}N-labeled purine 2′-deoxynucleosides, their incorporation into DNA fragments by chemical synthesis, and the results of NMR studies using these labeled DNA fragments.

Nuclear Magnetic Resonance (NMR) is the most efficient method for determining the solution structures of biomolecules. By applying multidimensional heteronuclear NMR techniques to $^{13}C/^{15}N$-labeled proteins, we can determine the solution structures of proteins with molecular mass of 20 to 30kDa at an accuracy similar to that of x-ray crystallography. Improvements in NMR instrumentation and techniques as well as the development of protein engineering methods for labeling proteins have rapidly advanced multidimensional heteronuclear NMR of proteins. In contrast, multidimensional heteronuclear NMR studies of nucleic acids is less advanced because there were no efficient methods for preparing large amounts of labeled DNA/RNA oligomers. In this report, we focused on the chemical synthesis of DNA oligomers labeled at specific residue(s). RNA oligomers with specific labels, which are difficult to synthesize by the enzyme method, can be synthesized by the chemical method. The specific labels are useful for conformational analysis of larger molecules such as protein-nucleic acid complexes.

This initial survey of ^{13}C relaxation in the △TAR RNA element has generated a number of interesting results that should prove generally useful for future studies. The most readily comparable study in the literature monitored ^{13}C relaxation of the methyl groups from unusual bases in $tRNA^{Phe}$. The study, which used T_1 and NOE data only, reported order parameters for the methyl group axis that ranged between 0.51 and 0.97-a range similar to that observed here. However, they reported a breakdown of the standard order parameter analysis at higher (118-MHz ^{13}C) frequencies, which should serve to emphasize the need for a thorough exploration of suitable motional models.

In summary, the ability to generate NMR quantities of ^{15}N and ^{13}C-labeled RNAs has led to the development of heteronuclear

multi-dimensional NMR techniques for simplifying the resonance assignment and structure determination of RNAs. These methods for synthesizing isotopically labeled RNAs are only several years old, and thus there are still relatively few applications of heteronuclear multi-dimensional NMR techniques to RNA. However, given the critical role that RNAs play in cellular function, one can expect to see an increasing number of NMR structural studies of biologically active RNAs.

Signs and magnitudes of scalar coupling constants-spin-spin splittings-comprise a very large amount of data that can be used to establish the conformations of RNA molecules. Proton-proton and proton-phosphorus splittings have been used the most, but the availability of ^{13}C-and ^{15}N-labeled molecules allow many more coupling constants to be used for determining conformation. We will systematically consider the torsion angles that characterize a nucleotide unit and the coupling constants that depend on the values of these torsion angles. Karplus-type equations have been established relating many three-bond coupling constants to torsion angles. However, one- and two-bond coupling constants can also depend on conformation. Serianni and coworkers measured carbon-proton coupling constants in ribonucleosides and have calculated their values as a function of conformation. The signs of two-bond coupling can be very useful because it is easier to measure a sign than an accurate magnitude.

Currently, there is a great emphasis on elucidating the structure, function, and dynamics of DNA. Much of the research involved in this study uses nuclear magnetic resonance (NMR) spectroscopy. Effective use of NMR spectroscopy for DNA molecules with mw > 10,000 requires stable isotope enrichment. We present strategies for site-specific isotopic labeling of the purine bases adenosine and guanosine and the biosynthesis of (U-^{13}C, ^{15}N) DNA from methylotropic bacteria. With commercially available 6-chloropurine, an effective two-step route leads to 2′-deoxy-(amino-^{15}N)adenosine (dA). The resulting d(amino-^{15}N)A is used in a series of reactions to synthesize 2′-deoxy-(2-^{13}C,1,amino-$^{15}N_2$)guanosine or any combination thereof. An improved biosynthesis of labeled DNA has been accomplished using Methylobacterium extorquens AS1. Each liter of growth medium contains 4 g of methanol to yield 1 g of lyophilized cells. As much as 200 mg of RNA per liter of culture has been obtained. We are currently developing large-scale isolation protocols. General synthetic pathways to oligomeric DNA will be presented.

Ribozymes, RNA enzymes, catalyze site-specific RNA cleavage and ligation reactions. We are studying the three-dimensional structure of a hairpin ribozyme derived from the minus strand of tobacco ring spot virus satellite RNA ((-)sTRSV), which has been engineering to specifically cleave the HIV-1 RNA. The minimum structure for the catalytic reaction involves a 50-nucleotide ribozyme and a 14-nucleotide substrate. The proposed secondary structure of the ribozyme-substrate complex consists of four short helices separated by two internal loops. The relatively large size (64-nucleotide) of the ribozyme-substrate complex presents formidable problems in solving the structure using NMR. Therefore we are studying smaller structural subunits of the complex. We are determining the high resolution structure of the symmetric internal loop involving the cleavage site and the flanking helices. One strand of the internal loop was selectively ^{13}C-labeled at C8 of each purine and C6 of each pyrimidine. By using ^{13}C-edited two-dimensional NMR, the proton NOESY spectrum was greatly simplified. This allowed unambiguous sequential proton resonance assignments along each strand. Three-dimensional ^{1}-^{13}C HMQC-NOESY was used to further facilitate resonance assignments. We are also enzymatically synthesizing the entire 50-nucleotide ribozyme and will combine it with the ^{13}C-labeled substrate. Through comparison of the NOE connectivities of the labeled nucleotides from the internal loop alone with those from the entire complex, the differences between the two structures can be elucidated.

24691 (LA–12893-C, pp. 344) **NMR studies of two spliced leader RNAs using isotope labeling.** Lapham, J. (Yale Univ., New Haven, CT (United States)); Crothers, D.M. Spliced leader RNAs are a class of RNA molecules (<200 nts) involved in the trans splicing of messenger RNA found in trypanosomes, nematodes, and other lower eukaryotes. The spliced leader RNA from the trypanosome Leptomonas Collosoma exists in two alternate structural forms with similar thermal stabilities. The 54 nucleotides on the 5′ end of the SL molecule is structurally independent from the 3′ half of the RNA, and displays the two structural forms. Furthermore, the favored of the two structures was shown to contain anomalous nuclease sensitivity and thermal stability features, which suggests that there may be tertiary interactions between the splice site and other nucleotides in the 5′ end. Multidimensional NMR studies are underway to elucidate the structural elements present in the SL RNAs that give rise to their physical properties. Two spliced leader sequences have been studied. The first, the 54 nucleotides on the 5′ end of the L. Collosoma sequence, was selected because of earlier studies in our laboratory. The second sequence is the 5′ end of the trypanosome Crithidia Fasciculata, which was chosen because of its greater sequence homology to other SL sequences. Given the complexity of the NMR spectra for RNA molecules of this size, we have incorporated $^{15}N/^{13}C$-labeled nucleotides into the RNA. One of the techniques we have developed to simplify the spectra of these RNA molecules is isotope labeling of specific regions of the RNA. This has been especially helpful in assigning the secondary structure of molecules that may be able to adopt multiple conformations. Using this technique one can examine a part of the molecule without spectral interference from the unlabeled portion. We hope this approach will promote an avenue for studying the structure of larger RNAs in their native surroundings.

24692 (LA–12893-C, pp. 345) **Application of heteronuclear couplings to conformational analysis of oligonucleotides.** Zhu, G. (Univ. of Maryland, College Park, MD (United States)); Live, D.; Bax, A. Los Alamos National Lab., NM (United States). Dec 1994.

The value of vicinal coupling constants extracted from NMR spectra in deducing torsion angles for conformational analysis is well recognized. Due to the abundance of protons, their couplings have been mostly widely used. In many instances, couplings between protons and other nuclei may be a valuable complement to proton-proton couplings or, in some instances, may be the only coupling available to characterize the torsion angle about a bond. Recently, heteronuclear couplings have been used to great benefit in studies of isotopically enriched proteins, and this general approach has been extended to peptides at natural abundance. The possibility of using this approach to study oligonucleotides is also attractive but has not as yet been widely exploited. With the development of strategies for labeling such molecules, particularly RNAs, this may become an important component in conformational analysis. For DNA, labeling is less accessible, but sufficient quantities of unlabeled material are readily available for measuring these couplings at natural abundance. We chose several DNA systems to explore the usefulness of heteronuclear couplings in addressing the sugar conformation and the glycosidic torsion angle. Intensities of cross peaks in long-range HMQC experiments can be related to the couplings. Crosspeaks involving H1′ and C1′ atoms have been emphasized because of the superior shift dispersion at these positions between sugar protons and carbon atoms. Results will be shown for the self-complementary Dickerson duplex dodecamer sequence d(CGCGAATTCGCG) and for d(GGTCGG), which dimerizes to form a G-tetrad structure incorporating both syn and anti base orientations. The couplings provide a clear discrimination between presence of C3′-endo and C2′-endo conformations of the sugars and syn and anti bases arrangements.

24693 (LA–12893-C, pp. 349) **Synthesis and applications of selectively ^{13}C-labeled RNA.** SantaLucia, J. Jr. (Univ. of California, Berkeley, CA (United States)); Shen, L.X.; Lewis, H.; Cai, Z.; Tinoci, I. Jr. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Spectral overlap is a substantial problem in NMR studies of RNA molecules >30 nucleotides. To overcome this difficulty, we synthesized selectively ^{13}C-labeled RNAs and adapted several isotope-edited two- and three-dimensional NMR experiments originally developed for protein studies. We optimized protocols for synthesis of multi-gram quantities of CTP, UTp, ATP, and GTP using a combination of synthetic organic and enzymatic methods. Uracil is prepared in 40 to 50% yield from ^{13}C-cyanide in two steps. Using acetyl- tribenzoyl-ribose and standard chemistry uracil is then attached to the sugar (90% yield). The tribenzoyl-uridine intermediate is converted into uridine or cytidine quantitatively, depending on the deblocking protocol. Labeled purines are synthesized using simple pyrimidine precursors and reacting with ^{13}C-formic acid (80% yield). Purine nucleosides are then synthesized using uridine phosphorylase and purine nucleoside phosphorylase. The nucleosides were converted to NMPs by treatment with $POCl_3$ in triethylphosphate. We converted NMPs to NTPs by standard enzymatic methods. Selectively labeled RNAs were synthesized by run-off transcription using ^{13}C-labeled NTPs. Several different strategies help solve over-lap problems in larger RNAs. Isotope-edited two-dimensional NMR experiments such as ω1-1/2 X-filtered NOESY simplify NMR spectra by dividing the normal NOESY spectrum into two subspectra-one involving NOEs from protons bound to ^{12}C and one from protons bound to ^{13}C. For example, we labeled A and U residues of a 34-nucleotide pseudoknot, and the ^{12}C subspectrum of the 1/2 X-filtered NOESY contained NOEs only from G and C residues (along with adenine 2H); the ^{13}C subspectrum contained NOEs only from A and U residues. Each subspectrum has less overlap than the NOESY of an unlabeled sample; the editing strategy allows each resonance to be identified by residue type (A, C, G, or U).

24694 (LA–12893-C, pp. 351) **Ner protein of phage Mu: Assignments using ^{13}C/^{15}N-labeled protein.** Strzelecka, T. (National Institutes of Health, Bethesda, MD (United States)); Gronenborn, A.M.; Clore, G.M. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

The Ner protein is a small (74-amino acid) DNA-binding protein that regulates a switch between the lysogenic and lytic stages of phage Mu. It inhibits expression of the C repressor gene and down-regulates its own expression. Two-dimensional NMR experiments on uniformly ^{15}N-labeled protein provided most of the backbone and some of the sidechain proton assignments. The secondary structure determination using two-dimensional NOESY experiments showed that Ner consists of five α-helices. However, because most of the sidechain protons could not be assigned, the full structure was not determined. Using uniformly ^{13}C/^{15}N-labeled Ner and a set of three-dimensional experiments, we were able to assign all of the backbone and 98% of the sidechain protons. In particular, the CBCANH and CBCA(CO)NH experiments were used to sequentially assign the Cα and Cβ resonances; the HCCH-CTOCSY and HCCH-COSY were used to assign sidechain carbon and proton resonances.

24695 (LA–12893-C, pp. 353) **NMR studies of bent DNA using ^{13}C-enriched samples.** Zimmer, D.P. (Yale Univ., New Haven, CT (United States)); Crothers, D.M. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

Bending of the DNA double helix can be brought about by introducing runs of adenines (A-tracts) in phase with the helical repeat of the DNA. The requirements for bending of DNA by A-tracts are that the length of the A-tract be greater than 3 base pairs and that the A-tracts must be in phase with the helical repeat (every 10 or 11 bp). Other factors, such as the number of adenines in the run, flanking sequences, and whether the A-tracts are phased with respect to the 5′A or the 3′A, have effects upon the degree of bending as assayed by electrophoretic mobility on native polyacrylamide gels. There are a number of models for bending A-tract DNA. The junction-bending model postulates that the structure of A-tracts is similar to the fiber diffraction structure of poly A, in which there is a significant degree of base pair tilt with respect to the helix axis. In this model, bending occurs at the junction between the A-tract and the B-form helix to allow favorable stacking interactions to occur. The bend of the helix could arise as a result of some other perturbation of B-form DNA by A-tracts, such as propeller twist; bending also could be due to a combination of factors. Our goal is to find the structural features of A-tracts responsible for bending of the helix by performing NMR on oligonucleotides containing A-tracts to obtain higher resolution structural data. One of the problems encountered in NMR structure determination of nucleic acids and other macromolecules is the assignment of resonances to nuclei. This procedure can be greatly facilitated through the use of ^{13}C-enriched nucleic acid samples. We are developing a technique for the enzymatic synthesis of labeled DNA for NMR. The technique we are developing is similar to RNA labeling techniques already in use. The technique involves growth of methylotrophic bacteria on $^{13}CH_3OH$.

24696 (DOE/ER/61252–T2) **CO_2 exchange, environmental productivity indices, and productivity of Agaves and Cacti under current and elevated atmospheric CO_2 concentrations. Terminal report.** California Univ., Los Angeles, CA (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-91ER61252. Order Number DE95013304. Source: OSTI; NTIS; GPO Dep.

The research described in the proposal investigated net CO_2 uptake and biomass accumulation for an extremely productive CAM plant, the prickly pear cactus Opuntia ficus-indica, under conditions of elevated CO_2 concentrations for relatively long periods. The influences of soil water status, air temperature, and the photosynthetic photon flux (PPF) on net CO_2 uptake over 24-h periods were evaluated to enable predictions to be made based on an Environmental Productivity Index (EPI). Specifically, EPI predicts the fraction of maximal daily net CO_2 uptake based on prevailing environmental conditions. It is the product of indices for temperature, soil water, and intercepted PPF, each of which range from 0.00 when that index factor completely inhibits net CO_2 uptake to 1.00 when no limitation occurs. For instance, the Water Index is 1.00 under wet conditions and decreases to 0.00 during prolonged drought. Although the major emphasis of the research was on net CO_2 uptake and the resulting biomass production for O. ficus-indica, effects of elevated CO_2 concentrations on root: shoot ratios and on the activities of the two carboxylating enzymes were also investigated. Moreover, experiments were also done on other CAM plants, including Agave deserti, Agave salmiana, and Hylocereus undatus, and Stenocereus queretaroensis.

The objective of this article is to list data resources needed for nuclear medicine and provide information on how to access them. This list will include publications of data compilations or evaluations, databases, and data processing codes for both nuclear structure and decay, as well as reaction data. Sources of bibliographic and related information on nuclear data are also be listed. The authors of this article have used their judgement in choosing a representative list of data sources; a more complete listing may be found in the references.

24698 (CONF-9505232–1) **Ligands for SPECT and PET imaging of muscarinic-cholinergic receptors of the heart and brain.** Knapp, F.F. Jr. (and others); McPherson, D.W.; Luo, H. Oak Ridge National Lab., TN (United States); George Washington Univ., Washington, DC (United States). [1995]. 36p. Sponsored by USDOE, Washington, DC (United States);National Insts. of Health, Bethesda, MD (United States). DOE Contract AC05-84OR21400 ; FG05-88ER60649. Grant No. NS-22215. From 5. Mediterranean symposium on nuclear medicine and radiopharmaceuticals - receptors; Athens (Greece); 23-28 May 1995. Order Number DE95012870. Source: OSTI; NTIS; GPO Dep.

Interest in the potential use of cerebral SPECT and PET imaging for determination of the density and activity of muscarinic-cholinergic receptors (mAChR) has been stimulated by the changes in these receptors which occur in many neurological diseases. In addition, the important involvement of mAChR in modulating negative inotropic cardiac activity suggests that such receptor ligands may have important applications in evaluation of changes which may occur in cardiac disease. In this paper, the properties of several key muscarinic receptor ligands being developed or which have been used for clinical SPECT and PET are discussed. In addition, the ORNL development of the new iodinated IQNP ligand based on QNB and the results of in vivo biodistribution studies in rats, in vitro competitive binding studies and ex vivo autoradiographic experiments are described. The use of radioiodinated IQNP may offer several advantages in comparison to IQNB because of its easy and high yield preparation and high brain uptake and the potential usefulness of the "partial" subtype selective IONP isomers. We also describe the development of new IQNP-type analogues which offer the opportunity for radiolabeling with positron-emitting radioisotopes (carbon-11, fluorine-18 and bromine-76) for potential use with PET.

24699 (CONF-9505232–2) **Interim report on intrathoracic radiotherapy of human small-cell lung carcinoma in nude mice with Re-188-RC-160, a radiolabeled somatostatin analogue.** Zamora, P.O. (Univ. of Bonn (Germany). Dept. of Nuclear Medicine); Bender, H.; Biersack, H.J.; Knapp, F.F. Jr. Oak Ridge National Lab., TN (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. Mediterranean symposium on nuclear medicine and radiopharmaceuticals - receptors; Athens (Greece); 23-28 May 1995. Order Number DE95014289. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this study was to evaluate the therapeutic efficacy of Re-188-RC-160 in experimental models of human small cell lung carcinomas which mimic the clinical presentation. In the experimental model, cells from the human small cell lung carcinoma cell line NCI-H69 cells were inoculated into the thoracic cavity of athymic mice and rats. Subsequently, the biodistribution of Re-188-RC-160 after injection into the pleural cavity, a radiolabeled somatostatin analogue, was monitored as was the effect on the subsequent growth of tumors. The results presented here, and which are a part of a larger series of studies, suggest that Re-188-RC-160 can be effectively used in this animal model to restrict the growth of small cell lung carcinoma in the thoracic cavity.

24700 (DOE/OR/00033–T641) **Manpower assessment brief: May 1995, No. 31.** Oak Ridge Inst. for Science and Education, TN (United States). 1995. 5p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE95015635. Source: OSTI; NTIS; GPO Dep.

The Health Physics/Radiation Protection Enrollments and Degrees, 1994 survey consisted of 53 institutions offering a major in health physics/radiation protection or radiation health, or an option program equivalent to a major (for example, in radiobiology or biophysics). Of the 53 programs, 1 program was new to the survey, 4 programs were suspended, allowing the students to complete their degrees, and 1 undergraduate program was suspended and reported the last degrees in 1994. As in previous years, adjustments have been made to prior years' data to reflect additional information or corrections received.

24701 (DOE/OR/00033–T656) **Health physics/radiation protection enrollments and degrees, 1994: Appendixes.** Oak Ridge Inst. for Science and Education, TN (United States). May 1995. 54p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE95015625. This report consists of tables of data on training of health physicists in the United States principally over the decade of 1983–1993.

24702 (NUREG/CR–6125-Vol.1) **Human factors evaluation of remote afterloading brachytherapy: Human error and critical tasks in remote afterloading brachytherapy and approaches for improved system performance. Volume 1.** Callan, J.R. (Pacific Science and Engineering Group, San Diego, CA (United States)); Kelly, R.T.; Quinn, M.L. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Pacific Science and Engineering Group, San Diego, CA (United States); University of California San Diego Medical Center, CA (United States). Div. of Radiation Oncology. May 1995. 215p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

Remote Afterloading Brachytherapy (RAB) is a medical process used in the treatment of cancer. RAB uses a computer-controlled

device to remotely insert and remove radioactive sources close to a target (or tumor) in the body. Some RAB problems affecting the radiation dose to the patient have been reported and attributed to human error. To determine the root cause of human error in the RAB system, a human factors team visited 23 RAB treatment sites in the US The team observed RAB treatment planning and delivery, interviewed RAB personnel, and performed walk-throughs, during which staff demonstrated the procedures and practices used in performing RAB tasks. Factors leading to human error in the RAB system were identified. The impact of those factors on the performance of RAB was then evaluated and prioritized in terms of safety significance. Finally, the project identified and evaluated alternative approaches for resolving the safety significant problems related to human error.

24703 (ORNL/TM–12965) **Nuclear medicine program progress report for quarter ending March 31, 1995.** Knapp, F.F. Jr.; Ambrose, K.R.; Beets, A.L.; Luo, H.; McPherson, D.W.; Mirzadeh, S. Oak Ridge National Lab., TN (United States). Jun 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013506. Source: OSTI; NTIS; GPO Dep.

In this report the conditions for "direct" labeling of the antigranulocyte (MAb) BW 250/183 monoclonal antibody with rhenium-188 (Re-188) from a generator are described. Re-188-BW 250/183 is of interest for potential use for bone marrow ablation. The labeling time, temperature, pH, and the amount of tin and citric acid were optimized utilizing IgG. Radiolabeling yields of greater than 97% were achieved using 1 mL of a phthalate/tartrate buffer (pH 5.M=?), 250 μ g BW 250/183, 1.0 mg citric acid, 400 μ g tin (II) chloride, and 1 mL of the tungsten-188/rhenium-188 generator eluent (200–800 μ Ci of Re-188). Analysis of the Re-188-labeled IgG and BW 250/183 was performed by Instant Thin Layer Chromatography (ITLC), Sephadex purification and High Performance Liquid Chromatography (HPLC). When the labeling was performed at room temperature or 37 C, in vitro stability studies performed in HSA solution, cysteine solution, 6 M urea solution and a 1% casein solution showed that the Re-188 label demonstrated a similar stability profile in all solutions. Initial studies indicate that Re-188-BW 250/183 retained ~ 90% of immunoreactivity when compared to the technetium-99m labeled antibody prepared from the same kit. During this period, several radioisotopes prepared in the ORNL HFIR were also supplied on a cost-recovery basis or provided to collaborators for ongoing collaborative projects. These include tin-117m, processed tungsten-188 and the ORNL alumina-based tungsten-188/rhenium-188 generators.

24704 (UCRL-JC–120641) **A computational method for comparing the behavior and possible failure of prosthetic implants.** Nielsen, C.; Hollerbach, K.; Perfect, S.; Underhill, K. Lawrence Livermore National Lab., CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9509172–1: Engineering in Medicine and Biology Society (EMBS) conference, Montreal (Canada), 20-23 Sep 1995). Order Number DE95013431. Source: OSTI; NTIS; GPO Dep.

Prosthetic joint implants currently in use exhibit high Realistic computer modeling of prosthetic implants provides an opportunity for orthopedic biomechanics researchers and physicians to understand possible in vivo failure modes, without having to resort to lengthy and costly clinical trials. The research presented here is part of a larger effort to develop realistic models of implanted joint prostheses. The example used here is the thumb carpo-metacarpal (cmc) joint. The work, however, can be applied to any other human joints for which prosthetic implants have been designed. Preliminary results of prosthetic joint loading, without surrounding human tissue (i.e., simulating conditions under which the prosthetic joint has not yet been implanted into the human joint), are presented, based on a three-dimensional, nonlinear finite element analysis of three different joint implant designs.

24705 (PNL-SA–26258) **Bench-scale/field-scale interpretations: Session overview.** Cunningham, A.B.; Peyton, B.M. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950483–4: 3. international symposium on in situ and on-site bioreclamation, San Diego, CA (United States), 24-27 Apr 1995). Order Number DE95014637. Source: OSTI; NTIS; INIS; GPO Dep.

In situ bioremediation involves complex interactions between biological, chemical, and physical processes and requires integration of phenomena operating at scales ranging from that of a microbial cell (10^{-6}) to that of a remediation site (10 to 1000 m). Laboratory investigations of biodegradation are usually performed at a relatively small scale, governed by convenience, cost, and expedience. However, extending the results from a laboratory-scale experimental system to the design and operation of a field-scale system introduces (1) additional mass transport mechanisms and limitations; (2) the presence of multiple phases, contants, and competing microorganisms (3) spatial geologic heterogeneities; and (4) subsurface environmental factors that may inhibit bacterial growth such as temperature, pH, nutrient, or redox conditions. Field bioremediation rates may be limited by the availability of one of the necessary constituents for biotransformation: substrate, contaminant, electron acceptor, nutrients, or microorganisms capable of degrading the target compound. The factor that limits the rate of bioremediation may not be the same in the laboratory as it is in the field, thereby leading, to development of unsuccessful remediation strategies.

24706 (UCRL-JC–120183) **Mechanisms of protein and virus crystal growth: An atomic force microscopy study of Canavalin crystallization.** Land, T.A. (Lawrence Livermore National Lab., CA (United States)); De Yoreo, J.J.; Malkin, A.J.; Kutznesov, Y.G.; McPherson, A. Lawrence Livermore National Lab., CA (United States). 10 Mar 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506203–1: 6. ICCG, The Hague (Netherlands), 18-23 Jun 1995). Order Number DE95014365. Source: OSTI; NTIS; INIS; GPO Dep.

The evolution of surface morphology and step dynamics during growth of single crystals of the protein Canavalin and of the cubic satellite tobacco mosaic virus crystals (STMV) have been investigated by in situ atomic force microscopy. These two crystals were observed to grow by very different mechanisms. Growth of Canavalin occurs on complex vicinal hillocks formed by multiple, independently acting screw dislocations. Small cluster were observed on the terraces. STMV on the other hand, was observed to grow by 2D nucleation of islands. No dislocations were found on the crystal. The results are used to determine the growth mechanisms and estimate fundamental materials parameters. The images also illustrate the important mechanism of defect incorporation and provide insight to the processes that limit the growth rate and uniformity of these crystals.

24707 (UCRL-JC–120177) **Modeling of ablation by photospallation using the computer program PUFF/DFRACT.** Antoun, T. (SRI International, Menlo Park, CA (United States)); Seaman, L.; Glinsky, M.E. Lawrence Livermore National Lab., CA (United States). 1 Mar 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950226–51: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95011753. Source: OSTI; NTIS; GPO Dep.

In general, macroscopic material failure is a manifestation of irreversible changes at the microscopic level. Many tissues, which may appear to be macroscopically homogeneous, are, at a fundamental microscopic level, a composite material. For example, cornea is composed of a hyaluronic acid matrix in which layers of collagen fibers are overlaid in a crossing pattern. The points where the collagen fibers intersect are potential nucleation sites for microscopic defects, which under the action of tensile stress, nucleate, grow and coalesce to form macroscopic failure planes, or spall

planes. Using a model based on microstructural evolution, this paper examines the failure process during photoablation. Specifically, the paper describes a physically motivated, micromechanical model based on the nucleation and growth of spherical voids. This model is then used to simulate photoablation of cornea. Potential for using this model to predict the stress wave and material damage measured by experiment is discussed.

24708 (PNL-SA–26069) **Adaptive life simulator: A novel approach to modeling the cardiovascular system.** Kangas, L.J. (and others); Keller, P.E.; Hashem, S. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950653–3: 1995 American control conference, Seattle, WA (United States), Jun 1995). Order Number DE95014634. Source: OSTI; NTIS; GPO Dep.

In this paper, an adaptive life simulator (ALS) is introduced. The ALS models a subset of the dynamics of the cardiovascular behavior of an individual by using a recurrent artificial neural network. These models are developed for use in applications that require simulations of cardiovascular systems, such as medical mannequins, and in medical diagnostic systems. This approach is unique in that each cardiovascular model is developed from physiological measurements of an individual. Any differences between the modeled variables and the actual variables of an individual can subsequently be used for diagnosis. This approach also exploits sensor fusion applied to biomedical sensors. Sensor fusion optimizes the utilization of the sensors. The advantage of sensor fusion has been demonstrated in applications including control and diagnostics of mechanical and chemical processes.

24709 (UCRL-ID–120740) **Spontaneous origin of topological complexity in the cerebral cortex.** Chapline, G. Lawrence Livermore National Lab., CA (United States). 7 Apr 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011698. Source: OSTI; NTIS; GPO Dep.

Attention is drawn to the possibility of regarding the cerebral cortex as a physical system whose only excitations are topological. An attractive feature of such a hypothesis is that it is possible to understand how local dynamics could spontaneously give rise to a large scale organization of neurons and synapses that one might associate with sophisticated cognitive capabilities. It is suggested that the spontaneous appearance of topological disorder in the topological phases of 2-D and 4-D quantum gravity illustrates how the topological complexity of the human brain can develop. In particular the cooperative behavior of different neural circuits in the cerebral cortex may be closely related to the topology of certain 4-manifolds.

24710 (CRIE-U–94011) **Development of technologies to prevent fish diseases by vaccination. 1. Adaptation of an ELISA to detect serum antibody and the effect of the vaccination for Japanese flounder.** Furuta, T. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Honda, H.; Kikuchi, K.; Iwata, N.; Kiyono, M. Central Research Inst. of Electric Power Industry, Abiko, Chiba (Japan). Jul 1994. 24p. (In Japanese). Order Number DE95790541. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

An examination was carried out on the adaptation of an ELISA for flounder and on the preparation and effect of a protective vaccination against edwardsiellosis. The measurement of flounder antibody by ELISA was made possible by successively making a rabbit antibody and an enzyme tagged goat antibody react to the flounder antibody. By ELISA, the antibodies were able to be measured with a sensitivity 5 to 6 times higher compared with the conventional agglutination. The vaccination was prepared experimentally by producing edwardsiella tarda in aquaculture, adding formalin to inactivate it, and cleaning it with a physiological salt water. The vaccination thus prepared was administered to 4 groups of flounder consisting of those weighing 3, 17, 146 and 516g by means of injection or immersion. After that, the measurement was taken of antibody titers by ELISA, and a challenge test was performed by injecting edwardsiella tarda. A rise in antibody titers was observed in all sizes under the injection and in a part of the 516g group of flounders under the immersion. The effect of the administration was such that the increase in protective immunity was recognized under the injection but not under the immersion. 33 refs., 11 figs., 1 tab.

24711 (CRIE-U–94020) **Literature survey on fish disease treatments in mari-culture systems (state-of-the-art and future subjects).** Kiyono, M. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Furuta, T.; Shinshima, K.; Ishikawa, Y. Central Research Inst. of Electric Power Industry, Abiko, Chiba (Japan). Aut 1994. 29p. (In Japanese). Order Number DE95790554. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

A data base system was formed concerning literatures on fish disease treatments. Comprehension for the present situation was also made on measures against fish disease based on these literal information, and the future directions were studied. Approximately 300 compilations (220 domestic and 80 overseas) of literatures were selected concerning the preventive measures and diagnostic techniques of fish disease that were made public in and after 1980; and the literature data base system (named FISHDIS) was formed by means of personal computers. This literature data base system enables extraction of required literature by key words and bibliographies, and it is capable of outputting a summary card describing the main points of information that is useful for the prevention or diagnosis. Medicines are mainly used for the treatments of bacterial fish disease and for the prevention of contagion. It is desirable to minimize the use of medicines, and development is in progress in the technique of early detection/diagnosis and disease prevention methods such as vaccination instead of using medicines. It is scheduled to further promote the development of disease prevention technology such as vaccination from now on. 49 refs., 2 figs., 2 tabs.

24712 **Detecting small holes in packages.** Kronberg, J.W.; Cadieux, J.R. To Dept. of Energy. 1993. Filed date 2 Jun 1993. U.S. Patent Application 8-070,196. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95015037. Source: OSTI; NTIS (US Sales Only); GPO Dep.

According to its major aspects and broadly stated, the present invention is a package with a product and tracer gas inside that lends itself to leak testing and a method for detecting the presence of a hole in a package. The tracer gas is preferably sulfur hexafluoride (SF_6), although other, nontoxic perfluorinated gases such as carbon tetrafluoride (CF_4) may also be used. A quantity of the tracer gas is put into the package along with the product and the package is closed. The concentration of the tracer gas in the atmosphere outside the package is then measured and compared to a predetermined value. A measured concentration greater than the predetermined value indicates that the packaging material may have a small hole in it. To ensure the safety of their products, food processors are required by law to assess the integrity of the packages they distribute. Ideally, all packages are inspected at-least visually. However, routine inspection of all packages is time-consuming and expensive, so testing is usually carried out on sample packages removed from the production line. Sampling offers a method for assessing the overall quality of the packages, but

cannot indicate which of the packages actually distributed by the manufacturer are defective.

24716 (DOE/CH/10330–T1) **Genetic effects of plutonium in Drosophila. Final technical report.** Alabama A and M Univ., Normal, AL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87CH10330. Order Number DE95014926. Source: OSTI; NTIS; GPO Dep.

This three year project, initiated in 1987, involved the genetic effects of alpha radiations on Drosophila. This document represents the final technical report. Plutonium residue was used as the alpha source of radon gas. Spontaneous mutation frequency in the Drosophila stock was very low. In the experiments using alpha radiation from radon gas, radiation doses as low as 20R induced significant numbers of mutations, with higher numbers of mutations at higher doses. If X-ray induced mutation frequencies reported in the literature are used for comparison, it can be concluded that alpha radiation from radon gas induces at least 2 to 3 time more mutations in Drosophila.

24717 (DOE/ER/60455–8) **Mechanisms for radiation damage in DNA. Progress report, June 1, 1994–May 31, 1995.** Sevilla, M.D. Oakland Univ., Rochester, MI (United States). Nov 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER60455. Order Number DE95014982. Source: OSTI; NTIS; INIS; GPO Dep.

In this project we have proposed several mechanisms for radiation damage to DNA and its constituents, and have detailed a series of experiments utilizing electron spin resonance spectroscopy, HPLC, GC-mass spectroscopy and ab initio molecular orbital calculations to test the proposed mechanisms. The results from these various techniques have resulted in an understanding of consequences of radiation damage to DNA from the early ionization event to the production of non-radical lesions (discussed in detail in Comprehensive Report). In this year's work we have found the hydroxyl radical in DNA's hydration layer. This is an important result which impacts the hole transfer hypothesis and the understanding of the direct vs. indirect effect in DNA. Further we have found the first ESR evidence for sugar radicals as a result of direct radiation damage to DNA nucleotides in an aqueous environment. This is significant as it impacts the biological endpoint of radiation damage to DNA and suggests future work in DNA. Work with DNA-polypeptides show clear evidence for electron transfer to DNA from the polypeptide which we believe is a radioprotective mechanism. Our work with ab initio molecular orbital theory has gain insight into the initial events of radiation damage to DNA. Ab initio calculations have provided an understanding of the energetics involved in anion and cation formation, ion radical transfer in DNA as well as proton transfer with DNA base pair radical ions. This has been extended in this year's work to new, more accurate values for the electron affinities of the DNA bases, understanding of the relative stability of all possible sugar radicals formed by hydrogen abstraction on the deoxyribose group, hydration effects on, thiol radioprotectors, and an ongoing study of radical intermediates formed from initial DNA ion radicals. During this fiscal year five articles have been published, three are in press, two are submitted and several more are in preparation.

24718 (DOE/ER/60455–9) **Mechanisms for radiation damadge in DNA.** Sevilla, M.D. Oakland Univ., Rochester, MI (United States). Nov 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER60455. Order Number DE95014699. Source: OSTI; NTIS; INIS; GPO Dep.

A comprehensive report is provided of the author's research since 1986 on radiolysis of DNA as well as current state of knowledge in this area. In particular study areas such as the influence of hydration on the absolute yield of primary ionic free radicals in irradiated DNA at 77K, Ab Initio molecular orbital calculations of DNA base pairs and their radical ions, and radiation-induced DNA damage as a function of hydration are discussed.

24719 (ENEA-RT-AMB–94-02) **X and gamma rays irradiation tests for evaluating performances of Italian dosimetry services.** Cavallini, A. (ENEA, Bologna (Italy). Area Energia Ambienete e Salute); Kaftal, S.; Klamert, V. ENEA, Bologna (Italy). Area Energia Ambienete e Salute. May 1994. 14p. Order Number DE95789728. Source: OSTI; NTIS (US Sales Only).

The ENEA (Italian Agency for New Technologies, Energy and the Environment)-EDP Group (Personal Dosimetry Experts) has already evaluated the reliability of more than 50% of the 70 Italian personal dosimetry services, which agreed to test their dosimeters through X and gamma irradiation in air. Film,TL and both film and TL are used as detectors. The X and gamma rays energy ranges from 30 keV to 1.250 keV (beam defined by ISO 4037). Exposures range from 5.2 10^{-6} C/kg to 1.3 10^{-3} C/kg. Some dosimeters have been irradiated with a single energy level and others with two energy levels. For each one of the nearly 4.000 dosimeters already tested, the ratio R has been calculated: $R = X_v/X_a$ where: X_v is the exposure evaluated by the service, X_a is the actual exposure. The R distributions have been analysed for the dosimeters using film or TL as detectors, as a function of irradiation energy and as a function of exposure values. The results obtained by all tested services are commented. Separate comments deal also with possible reasons of the failures to pass the tests.

24720 (GSF–4/95) **Risk and probability of causation of extrapulmonary cancers due to the occupational radiation exposure of workers at the previous WISMUT Uranium Mining**

Company. Jacobi, W.; Roth, P. GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Inst. fuer Strahlenschutz. Mar 1995. 86p. (In German). Sponsored by Hauptverband der Gewerblichen Berufsgenossenschaften e.V., St. Augustin (Germany). Order Number DE95795657. Source: OSTI; NTIS (US Sales Only); INIS.

For the evaluation of the lung cancer risk from inhaled radon progeny direct epidemiological data from other groups of uranium miners are available. These data yield, however, no quantitative evidence for extrapulmonary cancers. Therefore, in this study an indirect dosimetric approach for the evaluation of the possible excess relative risk (ERR) of extrapulmonary cancers among the WISMUT workers was applied. In this approach the following exposure pathways are taken into account: (1) The inhalation of radon and its short-lived progeny; (2) the inhalation of uranium (U-238, U-235) and its decay products with the ore dust; and (3) the tissue doses from external γ and β radiation. Tissue doses from inhaled radionuclides were calculated applying the new respiratory tract model recommended in ICRP Publication 68 (1994). The evaluation of the attributed ERR proceeds from the recently published data of the Life Span Study on the excess cancer incidence in the atomic bomb survivors, taking into account a DDREF of 2 and a radiation weighting factor of 20 for alpha radiation. For solid cancers a time-constant relative risk model was used, whereas for leukemias, lyphomas and myelomas the variation of the ERR with time since exposure was taken into regard. Central best estimates of the resulting ERR and the attributed probability of causation of extrapulmonary cancers are given for typical exposure conditions of the WISMUT uranium miners, particularly for the critical years 1946-55. For most extrapulmonary cancer types the ERR values are more than a factor of 10 lower than the corresponding value for lung or bronchial cancer, respectively. The only exemption concerns cancers in the extrathoracic region (Mouth region, pharynx and larynx) for which the ERR is only about a factor of 5 lower than the ERR for lung cancer. Finally, general conclusions and recommendations for the decision making in the individual acknowledgement procedure are outlined. (orig./HP)

24721 (JAERI-Data/Code–95-002) **Attenuation coefficients of human tissues and tissue substitutes.** Shirotani, Takashi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 63p. (In Japanese). Order Number DE95789319. Source: OSTI; NTIS; INIS.

Development of realistic torso phantom for the calibration of Pu chest counting system was completed in 1987. In order to manufacture the phantom, many human tissue substitutes (tissue equivalent materials) were newly developed. For the development, firstly, attenuation coefficients for 8 keV - 1 MeV photons were calculated for human tissues and organs listed in ICRP Reference Man document. Attenuation coefficients of the produced soft tissue substitutes (SZ-series) and bone substitutes (EZ-series) were also calculated in the same energy range. Moreover, for comparison, the calculations of attenuation coefficients for the existing plastics used as phantom materials, ICRU spherical phantom, Griffith phantom and others were carried out in the same way. In this report, the calculated mass and linear attenuation coefficients of these materials, and human tissues and organs are compiled. (author).

24722 (LA–12981-MS) **Table of DOE-STD-1027-92 Hazard Category 3 threshold quantities for the ICRP-30 list of 757 radionuclides: LANL fact sheet.** Clow, J.; Elder, J.; Heindel, G.; Inkret, W.; Miller, G. Los Alamos National Lab., NM (United States). Aug 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95016704. Source: OSTI; NTIS; INIS; GPO Dep.

A table of DOE-STD-1027-92 Hazard Category 3 threshold quantities, in units of curies and grams, is presented for the International Commission on Radiological Protection-30 (ICRP-30) list of 757 radionuclides. The specific activity (Ci/gm) used to convert the threshold quantities from curies to grams is also calculated and tabulated. The half-life values used to generate the specific activities are those specified in ICRP-30.

24723 (LNF-IR–95-017) **New methodologies of biological dosimetry applied to human protection.** Catena, C. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute); Parasacchi, P.; Conti, D.; Righi, E. Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Apr 1995. 74p. (In Italian). Order Number DE95789748. Source: OSTI; NTIS (US Sales Only).

Biological dosimetry is a diagnostic methodology for the measurement of the individual dose absorbed in the case of accidental overexposition to ionizing radiation. It is demonstrated how in vitro radiobiological and chemobiological studies using cytogenetic methods (count of chromosomal aberrations and micronuclei) on human lymphocytes from healthy subjects and individuals undergoing radiotherapy or chemotherapy, as well as on lymphocytes of mammals other than man (comparative cytogenetics), can help to increase the basic radiobiological and chemobiological scientific information. Such information gives a valid contribution to understanding of the action of ionizing radiation or of pharmaceuticals on cells and, in return, can be of value to human radioprotection and chemoprotection. Cytogenetic studies can be summerized as follows: (a) biodosimetry (estimate of dose received after accidental events); (b) individual radiosensitivity (level of individual response); (c) clinical radiobiology and chemobiology (individual response to radiopharmaceuticals, to radiotherapy and to chemopharmaceuticals); (d) comparative radiobiology (cytogenetic studies on species other than man); (e) animal model in the environmental surveillance.

24724 (ORISE–94/G-34) **Adjusting external doses from the ORNL and Y-12 facilities for the Oak Ridge Nuclear Facilities mortality study.** Watkins, J.P. (Oak Ridge Inst. for Science and Education, TN (United States)); Cragle, D.L.; West, C.M.; Tankersley, W.G.; Frome, E.L.; Crawford-Brown, D.J. Oak Ridge Inst. for Science and Education, TN (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE95013844. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents specific procedures used for adjusting radiation doses to radiation personnel at the ORNL and Y-12 plants during the early years. Topics discussed include: background information; selection of employment years to be considered; hardcopy monitoring methods and records; pocket meter data; and replacement of 1943 unmonitored employment years. These topics were discussed for both years.

24725 (ORISE–95/B-22) **Oak Ridge Institute for Science and Education, Medical Sciences Division report for 1994.** Snyder, F.; Poston, S.; Engle, J. (eds.). Oak Ridge Inst. for Science and Education, TN (United States). Medical Sciences Div. [1995]. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE95015624. Source: OSTI; NTIS; INIS; GPO Dep.

The primary mission of the Medical Sciences Division is (1) to conduct basic and applied biomedical research on human health related to energy systems, (2) to provide technical assistance and training in occupational and environmental medicine, and (3) to make related biomedical applications available to others through technology transfer. As can be gleaned from this report, the strengths and capabilities of their staff in carrying out this mission are closely aligned with the four core competencies of ORISE: (1) occupational and environmental health, (2) environmental and safety evaluation and analysis, (3) education and training, and (4) enabling research. Brief descriptions of the various scientific and technical programs and their progress, as well as the staff responsible for the accomplishments made during 1994, are presented in this report. Research programs include the following: biochemistry; cytogenetics; Center for Epidemiologic Research; Center for Human Reliability Studies; occupational medicine; Radiation Emergency Assistance Center/Training Site; and Radiation Internal Dose Information Center.

24726 (PNL–10614) **Hanford radiological protection support services annual report for 1994.** Lyon, M.; Bihl, D.E.; Fix, J.J.; Piper, R.K.; Froelich, T.J.; Olsen, P.C. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015592. Source: OSTI; NTIS; GPO Dep.

Various Hanford Site radiation protection services provided by the Pacific Northwest Laboratory for the US Department of Energy Richland Operations Office and Hanford contractors are described in this annual report for the calendar year 1994. These activities include external dosimetry measurements and evaluations, internal dosimetry measurements and evaluations, in vivo measurements, radiological record keeping, radiation source calibration, and instrument calibration and evaluation. For each of these activities, the routine program and any program changes or enhancements are described, as well as associated tasks, investigations, and studies. Program- related publications, presentations, and other staff professional activities are also described.

24727 (PNL-SA–26269) **Radical production in biological systems.** Johnson, J.R.; Akabani, G. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9410280–2: International workshop on radiation damage in DNA: relationships at early times, Gleneden, OR (United States), 1-6 Oct 1994). Order Number DE95014172. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes our effort to develop a metric for radiation exposure that is more fundamental than adsorbed dose and upon which a metric for exposure to chemicals could be based. This metric is based on the production of radicals by the two agents. Radicals produced by radiation in biological systems commonly assumed to be the same as those produced in water despite the presence of a variety of complex molecules. This may explain why the extensive efforts to describe the relationship between energy deposition (track structure) and molecular damage to DNA, based on the spectrum of radicals produced, have not been successful in explaining simple biological effects such as cell killing. Current models assume that DNA and its basic elements are immersed in water-like media and only model the production and diffusion of water-based radicals and their interaction with DNA structures; these models lack the cross sections associated with each macrocomponent of DNA and only treat water-based radicals. It has been found that such models are not realistic because DNA is not immersed in pure water. A computer code capable of simulating electron tracks, low-energy electrons, energy deposition in small molecules, and radical production and diffusion in water like media has been developed. This code is still in at a primitive stage and development is continuing. It is being used to study radical production by radiation, and radical diffusion and interactions in simple molecular systems following their production. We are extending the code to radical production by chemicals to complement our PBPK modeling efforts. It therefore has been developed primarily for use with radionuclides that are in biological materials, and not for radiation fields.

This report presents the details of a research program that investigated the impacts of elevated carbon dioxide on terrestrial ecosystems. This report focused on the effects of plant carbon allocation, microbial activity, soil changes, and nitrogen dynamics.

24729 (DOE/EW/50625–T22) **Environmental Hazards Assessment Program quarterly report, January–March 1995.** Medical Univ. of South Carolina, Charleston, SC (United States). 30 Apr 1995. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE95012199. Source: OSTI; NTIS; INIS; GPO Dep.

The objectives of the Environmental Hazards Assessment Program (EHAP) stated in the proposal to DOE are to: develop a holistic, national basis for risk assessment, risk management, and risk communication that recognizes the direct impact of environmental hazards on the health and well-being of all; develop a pool of talented scientists and experts in cleanup activities, especially in human health aspects; and identify needs and develop programs addressing the critical shortage of well-educated, highly-skilled technical and scientific personnel to address the health oriented aspects of environmental restoration and waste management. This report describes activities and reports on progress for the third quarter (January–March) of the third year of the grant. It reports progress against these grant objectives and the Program Implementation Plan published at the end of the first year of the grant. Questions, comments, or requests for further information concerning the activities under this grant can be forwarded to Jack Davis in the EHAP office of the Medical University of South Carolina at (803) 727-6450.

24730 (DOE/EW/50625–T23) **Environmental hazards assessment program. Annual report, July 1, 1994–June 30, 1995.** Medical Univ. of South Carolina, Charleston, SC (United States). 31 Jul 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE95016210. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes activities and reports on progress for the third year of the DOE grant to support the Environmental Hazards Assessment Program (EHAP). It reports progress against grant objectives and the Program Implementation Plan published at the end of the first year of the grant. As the program has evolved, more projects have been funded and many existing projects have become more complex. Thus, to accomplish better the objectives over the years and retain a solid focus on the total mission, we have reorganized the grant effort from three to five majoe elements: Public and professional outreach; Clinical programs; Science programs; Information systems; and, Program management.

24731 (DOE/EW/50625–T24) **Environmental Hazards Assessment Program. Quarterly report, April–June 1995.** Medical Univ. of South Carolina, Charleston, SC (United States). 31 Jul 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE95016211. Source: OSTI; NTIS; GPO Dep.

The objectives of this report are to: (1) develop a holistic, national basis for risk assessment, risk management, and risk communication that recognizes the direct impact of environmental hazards, both chemical and radiation, on the health and well-being of all; (2) develop a pool of talented scientists and experts in cleanup activities, especially in human health aspects; and (3) identify needs and develop programs addressing the critical shortage of well-educated, highly-skilled technical and scientific personnel to address the health oriented aspects of environmental restoration and waste management. This report describes the progress made this quarter in the following areas: public and professional outreach; science programs; clinical programs; and information support and access systems.

24732 (ENEA-RT-AMB–94-08) **Carbonaceous particles as carrier of toxicants in body.** Pagano, P. (ENEA, Bologna (Italy). Area Energia Ambiente e Salute); Bruni, S. ENEA, Bologna (Italy). Area Energia Ambiente e Salute. Jun 1994. 41p. (In Italian). Order Number DE95789711. Source: OSTI; NTIS (US Sales Only).

Gas and airborne particles interact in the atmosphere, especially in urban and highly industrialized areas, where combustion processes produce complex mixtures of chemicals including a great deal of carbonaceous particles. These carbonaceous particles catalyze and adsorb airborne substances that modify their biological disposition in the breathing body. The aim of this review is to collect the state of knowledge in the international field, on the role of carbonaceous particles as a carrier of chemicals in the body. This study is worked out in the Pluriannual Program of Inhalation Toxicology (INTO) of ENEA (Italian Agency for Energy, New Technologies and the Environment) to study the occurrence of early indicators of pulmonary diseases induced by inhalation of urban air pollutants.

24733 (ETDE-DE–146) **Application of selected biomonitoring plants in the scope of practical air pollution control. Pt. 1. Transfer of the results of exposure experiments with bioindicator plants to the local vegetation.** Sommer, B.; Kostka-Rick, R. Technischer Ueberwachungs-Verein Stuttgart e.V., Filderstadt (Germany). Fachabteilung Umweltwirkungen. Dec 1992. 332p. (In German). Sponsored by Umweltbundesamt, Berlin (Germany). Contract UFOPLAN 10802078. (UBA-FB–93-077/1). Order Number DE95791347. Source: OSTI; NTIS (US Sales Only).

The objective of this study is to enhance the applicability and acceptance of the use of response measurements, particularly that of active biomonitoring emploing the standardized grass exposure method. This was achieved by compiling a procedure for interpretation of results and deriving conclusions for measures to be taken in pursuit of specified goals, e.g. human or livestock health. One important consideration of this study is the transferability of results from active biomonitoring using the grass exposure method to the vegetation growing at the same location. The investigations were conducted by the TUeV Suedwest in two networks related to specified emission sources, where pollutant-responses are assessed routinely for the elements fluorine, lead and cadmium. Transfer factors based on threshold values are proposed for the elements fluorine and lead to relate results from the grass exposure method to pasture, grass, dandelion, red clover and white clover. Also, recommendations are derived for protecting grazing livestock and man as the final link in the food chain. The paper also presents transfer factors to relate the results from the standardized exposure of lettuce to field-grown lettuce and parsley. (orig.)

24734 (ETDE-DE–147) **Application of selected biomonitoring plants in the scope of practical air pollution control. Pt. 2. Development of an evaluation and assessment procedure on the basis of pollution effect measurements carried out in the Esslingen/Altbach region since 1983.** Franz-Gerstein, C.; Maier-Reiter, W.; Sommer, B. Technischer Ueberwachungs-Verein Stuttgart e.V., Filderstadt (Germany). Fachabteilung Umweltwirkungen. Dec 1992. 86p. (In German). Sponsored by Umweltbundesamt, Berlin (Germany). Contract UFOPLAN 10802078. (UBA-FB–93-077/2). Order Number DE95791346. Source: OSTI; NTIS (US Sales Only).

To date there is little coordination in the communication of data collected and compiled in the scope of practical air pollution control, each study being presented and interpreted separately and independently. This report presents a procedure to jointly evaluate and interpret such information. This procedure is illustrated using results from exposure-response studies, where results from different monitoring levels are compiled and compared. The major objective of this procedure is to provide a presentation and interpretation of results that differentiate with respect to the various criteria of protection. A brief introduction into biomonitoring methods and the legislative and formal basis of such investigations is given long with the presentation and discussion of this procedure. (orig.)

24735 (ETDE-DE–171) **Root growth and pH values in the rhizosphere of spruce as a function of acid sprinkle irrigation and liming. Final report.** Hahn, G. Hohenheim Univ., Stuttgart (Germany). Inst. fuer Pflanzenernaehrung. Feb 1994. 99p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0339175J. Order Number DE95796015. Source: OSTI; NTIS (US Sales Only).

The present study was executed as part of the "Hoeglwald" research project. The Hoeglwald near Augsburg is made up of healthy, stately spruce past 80 years of age. The soil is a podsolic Grey forest soiltype (pH4) with a mold cover. A study was made of the effects of different kinds of treatment, i.e. acid and neutral sprinkle irrigation and liming, on root growth and distribution, nutritive state, and soil pH in and outside the rhizosphere. The methods used were mostly nondestructive (root windows, pH microelectrodes, agar techniques). These were complemented by destructive methods, viz. soil cores, ingrowth cores, and chemical root analyses. A rhizotron was used for studying aluminium complexing in the rhizosphere of long roots by means of a combination of the aluminon method and agar techniques and for determining the content in organic acids of root exudate by means of HPLC. The results obtained permit the following conclusions. Acid sprinkle irrigation inhibits root growth in spruce whereas liming over the long term neutralises the effects of acid sprinkle irrigation on root growth. Average soil pH and aluminium concentration bear little information regarding root growth in spruce. Soil-chemical conditions in the rhizosphere are more specific determinants of root growth. The molar Ca/Al ratios used until now for assessing aluminium toxicity in spruce must be modified for field research. (orig.)

24736 (LA–12971-SR) **Aquatic macroinvertebrates and water quality of Sandia Canyon, Los Alamos National Laboratory, November 1993–October 1994.** Cross, S. Los Alamos National Lab., NM (United States). Aug 1995. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015054. Source: OSTI; NTIS; GPO Dep.

The Ecological Studies Team (EST) of ESH-20 at Los Alamos National Laboratory (LANL) has collected samples from the stream within Sandia Canyon since the summer of 1990. These field studies gather water quality measurements and collect aquatic macroinvertebrates from permanent sampling sites. Reports by Bennett (1994) and Cross (1994) discuss previous EST aquatic studies in Sandia Canyon. This report updates and expands those findings. EST collected water quality data and aquatic macroinvertebrates at five permanent stations within the canyon from November 1993 through October 1994. The two upstream stations are located below outfalls that discharge industrial and sanitary waste effluent into the stream, thereby maintaining year-round flow. Some water quality parameters are different at the first three stations from those expected of natural streams in the area, indicating degraded water quality due to effluent discharges. The aquatic habitat at the upper stations has also been degraded by sedimentation and channelization. The macroinvertebrate communities at these stations are characterized by low diversities and unstable communities. In contrast, the two downstream stations appear to be in a zone of recovery, where water quality parameters more closely resemble those found in natural streams of the area. The two lower stations have increased macroinvertebrate diversity and stable communities, further indications of downstream water quality improvement.

24737 (SREL–49) **STResS (Simulated Toxicant-Related Stress) documentation.** Greene, K.D.; Newman, M.C.; Jagoe, R.H. Savannah River Ecology Lab., Aiken, SC (United States). [1994]. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00819. Order Number DE95015348. Source: OSTI; NTIS; GPO Dep.

STResS (Simulated Toxicant-Related Stress) is a program written in DEC FORTRAN v. 6.2. This program can be run either interactively or batch mode. This program is designed to model the effects of toxicant exposure on a simulated population of a specific species, as well as the effects of the toxicant on the demographic and genetic characteristics. The toxic effect on the time-to-death is based on an accelerated failure time model in which the time-to-death depends on size, sex and genotype, toxicant concentration, and frequency and duration of exposure. Sexual, fecundity, and meiotic drive/gametic selection can also be included. Multiple simulations can be run for a user-specified number of gestation periods of user-specified length. The effect of winter can be included, and the exposure duration can be changed once during each simulation, if desired.

24738 (WHC-SA–2818) **The societal impact value of risk.** Simpson, D.E. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012572. Source: OSTI; NTIS; INIS; GPO Dep.

A key ill-defined issue in the management and regulation of potentially hazardous conditions is that of the value to be associated with a reduction (or existence) of human health risks, such as radiation exposure or hazardous substance ingestion. Empirical observations of societal behavior patterns lead to a relationship for the quantitative value of societal risk impact which is consistent with general societal risk acceptance, is not inconsistent with "de facto" risk regulation, and is suitable and appropriate as a specification or guide for risk management and risk regulation. This societal risk

impact expression is: Impact ($/year) = ($8 \times 10^7$) $NR_i^{4/3}$ where Ri = individual annual mortality risk; N = number of persons in the population sharing the risk and benefits. The change in impact which can be derived from a regulation or risk management activity is the value of annual benefit which society would expect to forego (or annual equivalent cost to incur) in consideration of the activity.

Safety is of paramount concern in todays high technology environment. Because of technological advances, there are numerous situations (high consequence operations) for which the implications of a safety failure are so severe that extreme attention to safety systems is essential. Some of those situations are: nuclear weapon detonation safety, nuclear reactor safety, dam safety, mass transit transportation safety, and hazardous materials transportation and handling safety. In each case, specific safety systems, human control, and administrative procedures have been designed to give a high level of assurance against disasters. In an overview sense, safety concepts can be divided into two broad approaches: active safety and passive safety. Active safety systems, in general, are based on the need for "functioning" elements (operating motors, operator action, etc.) and safety may be based in a large measure on "reliability" data (historical records of the operability success of components). Passive safety basically depends on non-functionality.

Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950740–59: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014238. Source: OSTI; NTIS; INIS; GPO Dep.

An exploratory study on seismic active control using an artificial neural network (ANN) is presented in which a singledegree-of-freedom (SDF) structural system is controlled by a trained neural network. A feed-forward neural network and the backpropagation training method are used in the study. In backpropagation training, the learning rate is determined by ensuring the decrease of the error function at each training cycle. The training patterns for the neural net are generated randomly. Then, the trained ANN is used to compute the control force according to the control algorithm. The control strategy proposed herein is to apply the control force at every time step to destroy the build-up of the system response. The ground motions considered in the simulations are the N21E and N69W components of the Lake Hughes No. 12 record that occurred in the San Fernando Valley in California on February 9, 1971. Significant reduction of the structural response by one order of magnitude is observed. Also, it is shown that the proposed control strategy has the ability to reduce the peak that occurs during the first few cycles of the time history. These promising results assert the potential of applying ANNs to active structural control under seismic loads.

24742 (ANL/RE/CP–86338) **Seismic evaluation methods for existing buildings.** Hsieh, B.J. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950740–56: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014247. Source: OSTI; NTIS; GPO Dep.

Recent US Department of Energy natural phenomena hazards mitigation directives require the earthquake reassessment of existing hazardous facilities and general use structures. This applies also to structures located in accordance with the Uniform Building Code in Seismic Zone 0 where usually no consideration is given to seismic design, but where DOE specifies seismic hazard levels. An economical approach for performing such a seismic evaluation, which relies heavily on the use of preexistent structural analysis results is outlined below. Specifically, three different methods are used to estimate the seismic capacity of a building, which is a unit of a building complex located on a site considered low risk to earthquakes. For structures originally not seismically designed, which may not have or be able to prove sufficient capacity to meet new arbitrarily high seismic design requirement and which are located on low-seismicity sites, it may be very cost effective to perform detailed site-specific seismic hazard studies in order to establish the true seismic threat. This is particularly beneficial, to sites with many buildings and facilities to be seismically evaluated.

24743 (BNL–61710) **Fractal dynamics of earthquakes.** Bak, P. (Brookhaven National Lab., Upton, NY (United States). Dept. of Physics); Chen, K. Brookhaven National Lab., Upton, NY (United States). 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95011783. Source: OSTI; NTIS; GPO Dep.

Many objects in nature, from mountain landscapes to electrical breakdown and turbulence, have a self-similar fractal spatial structure. It seems obvious that to understand the origin of self-similar structures, one must understand the nature of the dynamical processes that created them: temporal and spatial properties must necessarily be completely interwoven. This is particularly true for earthquakes, which have a variety of fractal aspects. The distribution of energy released during earthquakes is given by the Gutenberg-Richter power law. The distribution of epicenters appears to be fractal with dimension $D \approx 1–1.3$. The number of after shocks decay as a function of time according to the Omori power law. There have been several attempts to explain the Gutenberg-Richter law by starting from a fractal distribution of faults or stresses. But this is a hen-and-egg approach: to explain the Gutenberg-Richter law, one assumes the existence of another power-law–the fractal distribution. The authors present results of a simple stick slip model of earthquakes, which evolves to a self-organized critical state. Emphasis is on demonstrating that empirical power laws for earthquakes indicate that the Earth's crust is at the critical state, with no typical time, space, or energy scale. Of course the model is tremendously oversimplified; however in analogy with equilibrium phenomena they do not expect criticality to depend on details of the model (universality).

24744 (DOE/BC/14858–2) **Board on Earth Sciences and Resources and its activities.** National Academy of Sciences, Washington, DC (United States). Jun 1995. 8p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract FG22-94BC14858. Order Number DE95016226. Source: OSTI; NTIS; GPO Dep.

The Board on Earth Sciences and Resources (BESR) coordinates, the National Research Council's advice to the federal government on solid-earth science issues. The board identifies opportunities for advancing basic research and understanding, reports on applications of earth sciences in such areas as disaster mitigation and resource utilization, and analyzes the scientific underpinnings and credibility of earth science information for resource, environmental and other applications and policy decision. Committees operating under the guidance of the Board conducts studies addressing specific issues within the earth sciences. The current committees are as follows: Committee on Geophysical and Environmental Data; Mapping Sciences Committee; Committee on Seismology; Committee on Geodesy; Rediscovering Geography Committee; Committee on Research Programs of the US Bureau of Mines. The following recent reports are briefly described: research programs of the US Bureau of Mines, first assessment 1994; Mount Rainier, active cascade volcano; the national geomagnetic initiative; reservoir class field demonstration program; solid-earth sciences and society; data foundation for the national spatial infrastructure; promoting the national spatial data infrastructure through partnerships; toward a coordinated spatial data infrastructure for the nation; and charting a course into the digital era; guidance to the NOAA's nautical charting mission.

24745 (DOE/BC/14883–T2) **National Geoscience Data Repository System: Phase 2, Planning and pilot study. Progress report, February–April 1995.** Illinois Inst. of Tech., Chicago, IL (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14883. Order Number DE95014915. Source: OSTI; NTIS; GPO Dep.

The American Geological Institute (AGI) recently completed the first phase of a multiphase program to study and implement a National Geoscience Data Repository System (NGDRS) to capture and preserve valuable geoscientific data. They study was initiated in response to the fact that tens of billions of dollars worth of domestic eological and geophysical data are in jeopardy of being irrevocably lost or destroyed as a consequence of the ongoing downsizing of the US energy and minerals industry. The NGDRS would serve as an important and valuable source of information for the entire geoscience community for a variety of applications, including environmental protection, water resource management, global change studies, reducing risks from earthquakes and other geologic hazards, and basic and applied research. The repository system would also contain critical data that would enable domestic energy and minerals companies to expand their exploration and production programs in the United States for increased recovery of domestic oil, gas, and mineral resources. Progress is reported on the second phase of this program.

24746 (LA-SUB–95-59) **A specialized boundary element algorithm developed to calculate the state of stress in the Anza Gap, San Jacinto Fault Zone, Southern, CA.** Aster, R. (New Mexico Inst. of Mining and Technology, Socorro, NM (United States)); Flores, R.; Fehler, M. Los Alamos National Lab., NM (United States); New Mexico Inst. of Mining and Technology, Socorro, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012956. Source: OSTI; NTIS; GPO Dep.

The widely-used algorithm of Crouch and Starfield is unstable when used to solve our mixed boundary equation problem of interest. Altering the boundary conditions and correspondingly rearranging the system of equations to utilize double-sided boundary elements overcomes this drawback. The new algorithm described here is more physically realistic as in that it allows for rotation of the fault segments in the strain field resulting from satisfying the fault static shear strength condition. Preliminary test results indicate that a fault trifurcation gap model may describe the non-strike slip components to some of the seismicity.

24747 (LA-SUB–95-61) **Supercomputer modeling of volcanic eruption dynamics.** Kieffer, S.W. (Arizona State Univ., Tempe, AZ (United States)); Valentine, G.A.; Woo, Mahn-Ling. Los Alamos National Lab., NM (United States); Arizona State Univ., Tempe, AZ (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. LANL-Subcontract-9-XU2-U5117-1. Order Number DE95012957. Source: OSTI; NTIS; GPO Dep.

Our specific goals are to: (1) provide a set of models based on well-defined assumptions about initial and boundary conditions to constrain interpretations of observations of active volcanic eruptions–including movies of flow front velocities, satellite observations of temperature in plumes vs. time, and still photographs of the dimensions of erupting plumes and flows on Earth and other planets; (2) to examine the influence of subsurface conditions on exit plane conditions and plume characteristics, and to compare the models of subsurface fluid flow with seismic constraints where possible; (3) to relate equations-of-state for magma-gas mixtures to flow dynamics; (4) to examine, in some detail, the interaction of the flowing fluid with the conduit walls and ground topography through boundary layer theory so that field observations of erosion and deposition can be related to fluid processes; and (5) to test the applicability of existing two-phase flow codes for problems related to the generation of volcanic long-period seismic signals; (6) to extend our understanding and simulation capability to problems associated with emplacement of fragmental ejecta from large meteorite impacts.

24748 (LA-SUB–95-62) **Renewal: Continential lithosphere evolution as a function of tectonic environment.** McMillan, N.J. (New Mexico State Univ., Las Cruces, NM (United States). Dept. of Geological Sciences); Baldridge, W.S. Los Alamos National Lab., NM (United States); New Mexico State Univ., Las Cruces, NM (United States). Dept. of Geological Sciences. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. NEW MEXICO STATE UNIVERSITY. Order Number DE95012958. Source: OSTI; NTIS; GPO Dep.

The Cenozoic tectonic environment and stress regime of the southwestern United States have changed dramatically from compression during shallow-angle subduction during the Laramide orogeny in the early Cenozoic to the current mode of Basin and Range extension. Questions remain unresolved concerning the causes of this transition, including the timing of the initiation of extension (estimates range from 36 to 25 Ma), and is the Basin and Range simply an mega-example of back-arc extension, or is extension related to the subduction of an oceanic spreading center about 30 Ma? We have examined the patterns of magmagenesis and geochemical composition through Cenozoic time in southern New Mexico. We have defined four magma sources that have contributed to Cenozoic magmas. Immediately following the Laramide, magmas contain substantial contributions from the lower crust. Mid-Tertiary extension is related to the eruption of rhyolitic ash-flow tuffs and basalts. The basalts were generated by melting of the lithospheric mantle; intercalated rhyolites have a strong upper crustal signature. Eruption of basalts and andesites with sources in the lithospheric mantle and lower crust continued for several million years after rhyolitic volcanism ceased. The region was nearly void of volcanic activity for 16 million years despite continued extension, but at 10 Ma, basalts derived from the asthenosphere began to erupt.

24749 (SAND–95-8591) **Asynchronous global optimization techniques for medium and large inversion problems.** Pereyra, V. (Weidlinger Associates, Los Altos, CA (United States)); Koshy, M.; Meza, J.C. Sandia National Labs., Livermore, CA (United States). Apr 1995. 19p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951013–1: Annual meeting of the Society of Exploration Geophysicists, Houston, TX (United States), 8-12 Oct 1995). Order Number DE95011338. Source: OSTI; NTIS; GPO Dep.

We discuss global optimization procedures adequate for seismic inversion problems. We explain how to save function evaluations (which may involve large scale ray tracing or other expensive operations) by creating a data base of information on what parts of parameter space have already been inspected. It is also shown how a correct parallel implementation using PVM speeds up the process almost linearly with respect to the number of processors,

provided that the function evaluations are expensive enough to offset the communication overhead.

24750 (UCRL-ID–119352-Pt.1) **Loch Linnhe experiment 1994: Background stratification and shear measurements. Part 1: Profile summary and dispersion relations.** Robey, H.F.; Ravizza, D.L. Lawrence Livermore National Lab., CA (United States). 10 Oct 1994. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015381. Source: OSTI; NTIS; GPO Dep.

This report documents water column measurements made during the 1994 Loch Linnhe experiment, a joint US/UK radar ocean imaging experiment. Part 1 summarizes the profiles of temperature, salinity, density, Brunt-Vaisala frequency, and horizontal currents resolved into along and cross track directions. Internal wave dispersion relations, phase and group velocities, and eigenfunctions for modes 1 and 2 are computed for each profile. The effect of depth on these derived internal wave parameters is examined as well by computing eigenvalues and eigenfunctions for two different depths. The trials were conducted in Loch Linnhe, Scotland during the period from September 4, 1994 to September 17, 1994. The measurements reported herein were made from on board the R. V. Calanus, a research vessel operated by the Dunstaffnage Marine Laboratory (DML). The Calanus was moored approximately 125 meters from the track of the wake generating ship, either the R. V. Colonel Templer or a "Dog" class tug, the Collie. The depth at the mooring location was approximately 45 meters, while the depth at the closest point along the ship track was approximately 80 meters. For further details of the experiment, one is referred to the Loch Linnhe Experiment 1994: Trial Plan, Draft Version 3.0.

24751 (UCRL-ID–120121) **Hints on the use of the PCMDI Visualization and Computation System (VCS).** Williams, D.N.; Mobley, R.L.; Drach, R.S.; Phillips, T.J. Lawrence Livermore National Lab., CA (United States). Apr 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014380. Source: OSTI; NTIS; GPO Dep.

This report documents the Hints interactive displays that assist a user of the PCMDI Visualization and Computation System (VCS). These Hints describe the purpose of the VCS panels and provide basic instructions on their use.

24752 (UCRL-JC–116437-Rev.1) **Lithological and rheological constraints on fault rupture scenarios for ground motion hazard prediction. Revision 1.** Foxall, W.; Hutchings, L.; Jarpe, S. Lawrence Livermore National Lab., CA (United States). Sep 1994. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409167–1-Rev.1: International Union of Theoretical and Applied Mechanics symposium on mechanics problems in geodynamics, Beijing (China), 5-9 Sep 1994). Order Number DE95013262. Source: OSTI; NTIS; GPO Dep.

This paper tests a new approach to predict a range of ground motion hazard at specific sites generated by earthquakes on specific faults. The approach utilizes geodynamics to link structural, lithological and Theological descriptions of the fault zones to development of fault rupture scenarios and computation of synthetic seismograms. Faults are placed within a regional geomechanical model that is used to calculate stress conditions along the fault. The approach is based upon three hypothesis: (1) An exact solution of the representation relation that u@s empirical. Green's functions enables very accurate computation of ground motions generated by a given rupture scenario; (2) a general description of the rupture is sufficient; and (3) the structural, lithological and Theological characteristics of a fault can be used to constrain, in advance, possible future rupture histories. Ground motion hazard here refers to three-component, full wave train descriptions of displacement, velocity, and acceleration over the frequency band 0.01 to 25 Hz. Corollaries to these hypotheses are that the range of possible fault rupture histories is narrow enough to functionally constrain the range of strong ground motion predictions, and that a discreet set of rupture histories is sufficient to span the infinite combinations possible from a given range of rupture parameters.

24753 (UCRL-JC–116524) **The Beaverhead impact structure, SW Montana and Idaho: Implications for the regional geology of the western U.S.** Fiske, P.S.; Hargaves, R.B. Lawrence Livermore National Lab., CA (United States). 17 Mar 1994. 18p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Geological Survey, Reston, VA (United States). DOE Contract W-7405-ENG-48. Grant EAR 92-05975. (CONF-9308269–1: 3. the belt symposium, Whitefish, MT (United States), 14-21 Aug 1993). Order Number DE95014513. Source: OSTI; NTIS; GPO Dep.

The Beaverhead impact structure in SW Montana and Idaho is an allochthonous fragment of a large impact structure (~ 100 km diameter) that was transported some distance eastward during the Cretaceous Sevier orogeny. It is the first tectonic fragment of a large impact structure identified in the geologic record. The present evidence for impact consists of shatter cones, pseudotachylites, and planar deformation features in quartz. The age of the impact is not well constrained but is estimated to be Neoproterozoic to Cambrian (1000-500 Ma). The Beaverhead impact event must have created other features that may be preserved, elsewhere in western Montana and Idaho. These include proximal and distal ejecta (which may be misinterpreted as diamictites and/or tuff horizons) and other fragments of the crater floor containing shatter cones and pseudotachylite. A large circular gravity, magnetic and topographic anomaly, which could be the root of the impact structure, has been identified near Challis, Idaho. An enigmatic lithic tuff, identified in drill cores from the Challis area and an intraformational quartzite breccia in the Leaton Gulch area may be impact-related deposits, but no definitive evidence of shock metamorphism has been observed in these materials. The discovery of more pieces of the Beaverhead puzzle, as well as the recognition of other large impacts in the geologic record, are likely once the regional geologic community grows to accept the incidence of such events and becomes more familiar with the features of shock metamorphism in the field. To that end, the community of geologists in this area should integrate the Beaverhead structure into their research and teaching curriculum.

24754 (FNAL/C–95/064) **The Sloan Digital Sky Survey's use of the Web.** Petravick, D. (and others); Berman, E.; Gurbani, V. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Alfred P. Sloan Foundation. (CONF-9504170–1: Weaving the astronomy web conference, Strasbourg (France), 6-7 Apr 1995). Order Number DE95013240. Source: OSTI; NTIS; GPO Dep.

The Sloan Digital Sky Survey is a world-wide collaboration in astrophysics with contributors from around the United States, Italy, and Japan. Collaborators need to have easy access to current information about the project and the on-going software development. The World Wide Web (WWW) and HTML (HyperText Markup Language meet this need admirably. Our use of the Web can be thought of as providing access to three distinct types of information: (1) the infrastructure of the project, (2) the documentation of actual software used throughout the project, and (3) access to Survey databases. The layout of Web pages is not meant to allow the public to easily surf. Rather, the pages are laid out to permit collaborators to find information efficiently. In keeping with this goal, there is less emphasis on glitz and more on content.

6610 General Physics

24755 (LA-SUB–95-69) **The role of composition gradients in the evolution of uranus and neptune. Progress report, 1 January 1994–1 September 1994.** Marley, M.S. (New Mexico State Univ., Las Cruces, NM (United States)); Glatzmaier, G. Los Alamos National Lab., NM (United States); New Mexico State Univ., Las Cruces, NM (United States). [1994]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. LANL-Subcontract-9-XX3-1442E-1. Order Number DE95012959. Source: OSTI; NTIS; GPO Dep.

Thermal evolution models of Uranus and Neptune constructed over the last two decades overestimate the current luminosities of both planets. These models have also failed to explain the disparity between the relatively large excess luminosity of Neptune and the virtually undetectable one of Uranus. Our approach is to combine planetary evolution models with numerical simulations of convection in the presence of a stabilizing composition gradient. We have begun to adapt the global convection model to the conditions found in the interiors of Uranus and Neptune. When complete this model will calculate the mass and energy fluxes across double-diffusive interfaces in the interior of each planet needed in the new evolutionary calculations.

6611 Classical and Quantum Mechanics

24756 (LBL–36537) **Differential geometry on Hopf algebras and quantum groups.** Watts, P. Lawrence Berkeley Lab., CA (United States). 15 Dec 1994. 93p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant PHY-90-21139. (UCB-PTH–94/35). Order Number DE95006572. Source: OSTI; NTIS; INIS; GPO Dep.

The differential geometry on a Hopf algebra is constructed, by using the basic axioms of Hopf algebras and noncommutative differential geometry. The space of generalized derivations on a Hopf algebra of functions is presented via the smash product, and used to define and discuss quantum Lie algebras and their properties. The Cartan calculus of the exterior derivative, Lie derivative, and inner derivation is found for both the universal and general differential calculi of an arbitrary Hopf algebra, and, by restricting to the quasitriangular case and using the numerical R-matrix formalism, the aforementioned structures for quantum groups are determined.

6612 Techniques of General Use in Physics

24757 (ANL/ET/CP–82236) **Thermal characteristics of a low-loss liquid-helium dewar.** Cha, Y.S.; Niemann, R.C.; Hull, J.R. Argonne National Lab., IL (United States). May 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950336–28: American Society of Mechanical Engineers/Japanese Society of Mechanical Engineers/Japan Solar Energy Society international solar energy conference, Lahaina, HI (United States), 19-24 Mar 1995). Order Number DE95012271. Source: OSTI; NTIS; GPO Dep.

A liquid helium dewar has been designed, fabricated, and operated successfully with a minimum background heat-loss rate of only a few milliwatts. The objective is to provide a facility that can be used to measure relatively low heat-loss rate (1–100 milliwatts) in a liquid helium environment. The experimental system consists mainly of an inner helium reservoir within an outer helium reservoir that is thermally shielded from the room-temperature environment by multiple insulation layers in a vacuum environment and a liquid nitrogen reservoir. The inner helium reservoir has a reduced cross-sectional (neck) area to minimize radiative and convective heat transfer to the liquid helium in the lower portion of the reservoir. Experimental results indicate that it takes a long time (>16 hours) for the system to cool down and reach the minimum heat-loss condition. Strong thermal interactions were observed between the inner and the outer reservoirs above the reduced cross-sectional area of the inner reservoir which is separated from the outer reservoir by a cylindrical stainless steel wall. Temperature measurements showed stratification in the vapor space above the liquid helium in the inner reservoir. Temperature distributions in the vapor space are not one-dimensional, and horizontal temperature gradients exist; this strongly suggests that natural convection may have persisted in the vapor space above the liquid helium in the inner reservoir. To alleviate the problem of strong thermal interactions between the inner and the outer reservoirs, we have since redesigned and tested an improved inner helium reservoir. The new reservoir has a heat intercept, an extended vacuum insulating space between the two helium reservoirs above the heat intercept, and an upper portion made of a thermally insulating epoxy fiberglass composite. Testing showed that interaction between the inner and the outer helium reservoirs of the new system is significantly lower than the original system.

24758 (DOE/ER/75873–T1) **Development of a novel neutron source with applications in calibration and monitoring. Final report.** Miley, G.H. Illinois Univ., Urbana, IL (United States). Apr 1995. 3p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract FG02-93ER75873. NAS7-1235. Order Number DE95015112. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this research project, development of a unique portable inertial electrostatic confinement (IEC) neutron source (10^6 2.5-MeV neutrons/second-level) has been achieved. A majority of the experimental work required for the project was reported in the 1993 Annual Report. (The abstract and table of contents for that report are included here as Appendix A for convenience. Full copies can be obtained upon request to the PI.) Unfortunately, the DOE program providing support for the project was canceled and funding was not available to continue the project in 199495. However, to provide time to explore some innovative potential applications for upgraded versions of the IEC, a no-cost extension of the contract was requested and granted in 1994. This follow-on work, mostly involving conceptual design studies, is reported here.

24759 (LA-UR–95-1539) **Application of a transverse phase-space measurement technique for high-brightness, H^- beams to the GTA H^- beam.** Johnson, K.F. (Los Alamos National Lab., NM (United States)); Garcia, R.C.; Rusthoi, D.P.; Sander, O.R.; Sandoval, D.P.; Shinas, M.A.; Smith, M.; Yuan, V.W.; Connolly, R.C. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by Department of the Army, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–144: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011982. Source: OSTI; NTIS; INIS; GPO Dep.

The Ground Test Accelerator (GTA) had the objective Of Producing a high-brightness, high-current H-beam. The major components were a 35 keV injector, a Radio Frequency Quadrupole (RFQ), an intertank matching section (IMS), and a drift tube linac (DTL), consisting of 10 modules. A technique for measuring the transverse phase-space of high-power density beams has been developed and tested. This diagnostic has been applied to the GTA H-beam. Experimental results are compared to the slit and collector technique for transverse phase-space measurements and to simulations.

24760 (LBL-PUB–754, pp. 191-201) **Radiation and gas conduction heat transport across a helium dewer multilayer insulation system.** Green, M.A. (Lawrence Berkeley Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). Feb 1995. DOE Contract AC03-76SF00098. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes a method for calculating mixed heat transfer through the multilayer insulation used to insulated a 4K liquid helium cryostat. The method described permits one to estimate the insulation potential for a multilayer insulation system from first principles. The heat transfer regimes included are: radiation, conduction by free molecule gas conduction, and conduction through continuum gas conduction. Heat transfer in the transition region between the two gas conduction regimes is also included.

24761 (DOE/ER/13670–T5) **Solar variability observed through changes in solar limb-darkening function and mean diameter. Progress report.** Arizona Univ., Tucson, AZ (United States). Dept. of Physics. [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13670. Order Number DE95013840. Source: OSTI; NTIS; INIS; GPO Dep.

This is a progress report on work on the SCLERA project which is a ground-based program for monitoring and measuring information on solar luminosity by means of observed changes in the solar limb-darkening function, shape, and diameter. Ground based measurements offer major cost advantages over satellite systems, though offering more challenging problems in data collection and interpretation. This report discusses progress in the field of interpreting such data, and the development of instrumentation and models to account for the observed results.

24762 (DOE/ER/40537–43) **The Russian-American gallium solar neutrino experiment.** Elliott, S.R. (Univ. of Washington, Seattle, WA (United States)); Wilkerson, J.F.; Abdurashitov, J.N. Washington Univ., Seattle, WA (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40537. Order Number DE95015921. Source: OSTI; NTIS; GPO Dep.

The Russian-American Gallium solar neutrino Experiment (SAGE) is described. The solar neutrino flux measured by 31 extractions through October, 1993 is presented. The result of 69 $\pm$ 10_{-7}^{+5} SNU is to be compared with a standard solar model prediction of 132 SNU. The status of a ^{51}Cr neutrino source irradiation to test the overall operation of the experiment is also presented.

24763 (ENEA-RT-ERG-FUS–94-29) **Implementing simulations of isotropic turbulence in highly parallel computers.** Pais, V.A. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione). Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). Mar 1995. 16p. Order Number DE95789774. Source: OSTI; NTIS (US Sales Only).

The first steps for the simulation of isotropic turbulence in Newtonian incompressible fluids are done in such a way to acquire a basic knowhow. Highly parallel hardware and techniques are used following previous published papers. An elementary stability analysis is provided. The preliminary tests are carried out and the results indicate that the implemented codes are operational.

24764 (JINR-R–2-94-150) **Gravitational energy and gravitational waves.** Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1994. 159p. (In Russian). (CONF-9310435–: 6. Seminar on the gravitational energy and gravitational waves, Dubna (Russian Federation), 26-30 Oct 1993). Order Number DE95633241. Source: OSTI; NTIS (US Sales Only); INIS.

The papers of the International symposium after N.I. Lobachevsky Gravitational energy and gravitational waves at Dubna in December 1993 are presented. The main attention is paid to the gravitation theory, gravitational field energy density, gravitational waves and radiation.

24765 (LA-SUB–95-88) **Simulational studies of the Farley-Buneman in the equatorial electrojet.** Otani, N. (and others); Seyler, C.; Kelley, M. Los Alamos National Lab., NM (United States). [1995]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95014567. Source: OSTI; NTIS; GPO Dep.

The Farley-Buneman instability in the equatorial electrojet current system in the E-region of the ionosphere has been identified as the cause of the observed Type I electron density irregularities. The goal of this work was to study the instability in the equatorial region.

24766 (LBL-PUB–754, pp. 143-159) **On the smoothness of electric fields near plane gratings of cylindrical conductors.** Judd, D.L. (Lawrence Berkeley Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

The electric field near an infinite plane grating of equally spaced round rods at the same potential, forming the boundary of a uniform field, is determined analytically to good accuracy by conformal transformations and evaluated numerically. This contribution, which has a frankly pedagogical flavor, to the Klaus Halbach Festschrift is offered to honor his displayed mastery of conformal techniques. Although the numerical work and the form of its presentation are new, the transformation used is not original. However, to locate its antecedents in an archival journal it was necessary to seek out a paper published in 1923 (close to the year of his birth, and of mine), in a place obscure to modern physicists, so the authors efforts cannot be said to replicate recent published work. A new insight is obtained in the form of a simple estimate of departures from field uniformity at all distances from rods of any size.

24767 (LBL-PUB–754, pp. 219-242) **Some ideas on the choice of designs and materials for cooled mirrors.** Howells, M.R. (Lawrence Berkeley Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). Feb 1995. DOE Contract AC03-76SF00098. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

Here the author expresses some of his views on how the fabrication of future synchrotron beam-line optics ought to be approached. Many of the most interesting new ideas for beam-line mirrors, especially those with a promise of low costs, involve metals. Historically these materials had posed certain problems, but these have been overcome in recent times to the extent that the initial complement of Advanced-Light-Source (ALS) beam-line optics were made of metal and have met their specifications. To go furthere along that road one needs to get more interested in the metallurgical issues involved in making high-quality metal mirrors. The author recounts the results of some investigations into these materials questions and trys to draw on some of the experiences and achievements of these communities which have hitherto had only limited contact with synchrotron radiation researchers.

24768 (LNF-P–95-010) **Detection of gravitational waves with spherical antennas.** Coccia, E. (Rome Univ. II (Italy). Dipt. di Fisica); Lobo, J.A. Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Apr 1995. 25p. (CONF-9409359–1: 11. Italian conference on general relativity and gravitational physics, Trieste (Italy), 26-30 Sep 1994). Order Number DE95789750. Source: OSTI; NTIS (US Sales Only).

The authors report on an investigation of the possibilities offered by solid resonant spheres to detect gravitational radiation. A spherical detector has isotropic sensitivity and can determine the source direction and wave polarisation providing vetoes on General Relativity. A deconvolution procedure for a general gravitational wave is described, along with tests and vetoes on the trace and transversality properties of gravitational waves. The sphere's gravitational wave absorption cross section is large at two frequencies and if the wave direction is known, a spherical detector can determine all the six polarisation states predicted by the most general metric theory. Assuming General Relativity, a two sphere observatory completes the deconvolution process, removing the 180° ambiguity in the source position, enabling the determination of the gravitational wave speed and providing powerful vetoes on local disturbances. The authors discuss the sensitivity of spheres of different materials and frequencies of operation. A 3 metres diameter A15056 sphere is shown to be able to reach a 1 ms burst sensitivity of $h \approx = 6 \times 10^{-22}$ if operated at the quantum limit.

24769 (SAND–93-0499) **Boltzmann-equation simulations of radio-frequency-driven, low-temperature plasmas.** Drallos, P.J.; Riley, M.E. Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95007716. Source: OSTI; NTIS; INIS; GPO Dep.

We present a method for the numerical solution of the Boltzmann equation (BE) describing plasma electrons. We apply the method to a capacitively-coupled, radio-frequency-driven He discharge in parallel-plate (quasi-1D) geometry which contains time scales for physical processes spanning six orders of magnitude. Our BE solution procedure uses the method of characteristics for the Vlasov operator with interpolation in phase space at early time, allowing storage of the distribution function on a fixed phase-space grid. By alternating this BE method with a fluid description of the electrons, or with a novel time-cycle-average equation method, we compute the periodic steady state of a He plasma by time evolution from startup conditions. We find that the results compare favorably with measured current-voltage, plasma density, and "cited state densities in the "GEC" Reference Cell. Our atomic He model includes

five levels (some are summed composites), 15 electronic transitions, radiation trapping, and metastable-metastable collisions.

24770 (SAND–94-1735) **Velocity boundary conditions for vorticity formulations of the incompressible Navier-Stokes equations.** Kempka, S.N. (Sandia National Labs., Albuquerque, NM (United States)); Strickland, J.H.; Glass, M.W.; Peery, J.S.; Ingber, M.S. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012525. Source: OSTI; NTIS; GPO Dep.

formulation to satisfy velocity boundary conditions for the vorticity form of the incompressible, viscous fluid momentum equations is presented. The tangential and normal components of the velocity boundary condition are satisfied simultaneously by creating vorticity adjacent to boundaries. The newly created vorticity is determined using a kinematical formulation which is a generalization of Helmholtz' decomposition of a vector field. Though it has not been generally recognized, these formulations resolve the over-specification issue associated with creating voracity to satisfy velocity boundary conditions. The generalized decomposition has not been widely used, apparently due to a lack of a useful physical interpretation. An analysis is presented which shows that the generalized decomposition has a relatively simple physical interpretation which facilitates its numerical implementation. The implementation of the generalized decomposition is discussed in detail. As an example the flow in a two-dimensional lid-driven cavity is simulated. The solution technique is based on a Lagrangian transport algorithm in the hydrocode ALEGRA. ALEGRA's Lagrangian transport algorithm has been modified to solve the vorticity transport equation and the generalized decomposition, thus providing a new, accurate method to simulate incompressible flows. This numerical implementation and the new boundary condition formulation allow vorticity-based formulations to be used in a wider range of engineering problems.

24771 (UCRL-ID–120746) **A search for optical counterparts of gamma-ray bursts. Final report.** Park, Hye-Sook. Lawrence Livermore National Lab., CA (United States). 9 Mar 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013248. Source: OSTI; NTIS; GPO Dep.

Gamma Ray Bursts (GRBS) are mysterious flashes of gamma rays lasting several tens to hundreds of seconds that occur approximately once per day. NASA launched the orbiting Compton Gamma Ray Observatory to study GRBs and other gamma ray phenomena. CGRO carries the Burst and Transient Experiment (BATSE) specifically to study GRBS. Although BATSE has collected data on over 600 GRBS, and confirmed that GRBs are localized, high intensity point sources of MeV gamma rays distributed isotropically in the sky, the nature and origin of GRBs remains a fundamental problem in astrophysics. BATSE's 8 gamma ray sensors located on the corners of the box shaped CGRO can detect the onset of GRBs and record their intensity and energy spectra as a function of time. The position of the burst on the sky can be determined to $< \pm 10^{\circ}$ from the BATSE data stream. This position resolution is not sufficient to point a large, optical telescope at the exact position of a GRB which would determine its origin by associating it with a star. Because of their brief duration it is not known if GRBs are accompanied by visible radiation. Their seemingly large energy output suggests thatthis should be. Simply scaling the ratio of visible to gamma ray intensities of the Crab Nebula to the GRB output suggests that GRBs ought to be accompanied by visible flashes of magnitude 10 or so. A few photographs of areas containing a burst location that were coincidentally taken during the burst yield lower limits on visible output of magnitude 4. The detection of visible light during the GRB would provide information on burst physics, provide improved pointing coordinates for precise examination of the field by large telescope and provide the justification for larger dedicated optical counterpart instruments. The purpose of this experiment is to detect or set lower limits on optical counterpart radiation simultaneously accompanying the gamma rays from.

24772 (UCRL-JC–120862) **EUVE photometry of SS Cygni: Dwarf nova outbursts and oscillations.** Mauche, C.W. Lawrence Livermore National Lab., CA (United States). 15 May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9503167–1: 1995 International Astronomical Union (IAU) colloquium #152 on astrophysics in the extreme ultraviolet, Berkeley, CA (United States), 27-30 Mar 1995). Order Number DE95014394. Source: OSTI; NTIS; GPO Dep.

The authors present EUVE Deep Survey photometry and AAVSO optical measurements of the 1993 August and 1994 June/July outbursts of the dwarf nova SS Cygni. The EUV and optical light curves are used to illustrate the different response of the accretion disk to outbursts which begin at the inner edge and propagate outward, and those which begin at the outer edge and propagate inward. Furthermore, the authors describe the properties of the quasi-coherent 7–9 s sinusoidal oscillations in the EUV flux detected during the rise and plateau stages of these outbursts.

24773 (ANL-HEP-TR–95-26) **High Energy Physics Division semiannual report of research activities, July 1, 1994–December 31, 1994.** Wagner, R.; Schoessow, P.; Talaga, R. Argonne National Lab., IL (United States). Apr 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95013583. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the research conducted in the High Energy Physics Division of Argonne National Laboratory during the period of July 1, 1994–December 31, 1994. Topics covered here include experimental and theoretical particle physics, advanced accelerator physics, detector development, and experimental facilities research. Lists of division publications and colloquia are included.

24774 (DOE/ER/10690–11) **1991 Technical progress report of the University of South Carolina's High Energy Physics Group, February 1990–July 1991.** South Carolina Univ., Columbia, SC (United States). [1991]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AS09-80ER10690. Order Number DE95016073. Source: OSTI; NTIS; INIS; GPO Dep.

The high energy physics group at the University of South Carolina includes five teaching faculty members, one research faculty member, and five graduate students. Profs. Childers, Darden, and Wilson devote most of their research effort to Fermilab experiment E789, which is designed to observe charmless two-body decays of b-flavored mesons and baryons. Prof. Wilson works on Fermilab experiment E687 which studies charm physics in the wide-band photon beam. Profs. Rosenfeld and Wang participate in the AMY collaboration, which studies electron-positron interactions using the TRISTAN collider at KEK. Prof. Rosenfeld and one student collaborate with personnel from KEK and INS, Tokyo, on an experiment to detect a 17 keV neutrino in the β-decay spectrum of ^{63}Ni. Members of the group also participate in Fermilab Proposal P803 which will search for the oscillation of muon neutrino to tau neutrino with sensitivity better than a factor of 40 than previously achieved and in Superconducting Super Collider activities which include the development of an imaging preradiator. A brief discussion is given on progress made for each program.

24775 (DOE/ER/10690–12) **1992 Technical progress report of the University of South Carolina's High Energy Physics Group.** South Carolina Univ., Columbia, SC (United States). [1992]. 17p. Professors Rosenfeld and Wang participate in the AMY collaboration, which studies electron-positron interactions using the TRISTAN collider at KEK. Prof. Rosenfeld and one student collaborate with personnel from KEK and INS,

Tokyo, on an experiment to detect a 17 keV neutrino in the β-decay spectrum of ^{63}Ni. Profs. Avignone and Rosenfeld are charter members of Fermilab proposal P803, which will search for the oscillation of muon neutrino to tau neutrino with sensitivity better than a factor of 40 than previously achieved. A brief discussion on the progress of each program is given.

24776 (DOE/ER/40272–213) **Research in theoretical elementary particle physics at the University of Florida: Task A. Annual progress report.** Field, R.D.; Ramond, P.M.; Sikivie, P.; Thorn, C.B. Florida Univ., Gainesville, FL (United States). 1 Dec 1994. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER40272. (UFIFT-HEP–94-18). Order Number DE95010162. Source: OSTI; NTIS; INIS; GPO Dep.

This is the Annual Progress Report of the theoretical particle theory group at the University of Florida under DOE Grant DE-FG05-86ER40272. At present our group consists of four Full Professors (Field, Ramond, Thorn, Sikivie), one Associate Professor (Woodard), and two Assistant Professors (Qiu, Kennedy). In addition, we have four postdoctoral research associates and seven graduate students. The research of our group covers a broad range of topics in theoretical high energy physics including both theory and phenomenology. Included in this report is a summary of the last several years, an outline of our current research program.

24777 (SSCL-Preprint–542) **Physics Research Integrated Development Environment (PRIDE).** Burton, J.; Cormell, L. Superconducting Super Collider Lab., Dallas, TX (United States). Dec 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011152. Source: OSTI; NTIS; INIS; GPO Dep.

Past efforts to implement a Software Engineering approach to High Energy Physics computing have been met with significant resistance and have been, in many cases, only marginally successful. At least a portion of the problem has been the Lick of an integrated development environment, tailored to High Energy Physics and incorporating a suite of Computer Aided Software Engineering tools. The Superconducting Super Collider Physics Research Division Computing Department is implementing pilot projects to develop just such an environment.

24778 (SSCL-Preprint–552) **Review of experiments.** Lueth, V. Superconducting Super Collider Lab., Dallas, TX (United States). Aug 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930823–22: 15. international symposium on lepton and photon interactions, Ithaca, NY (United States), 10-15 Aug 1993). Order Number DE95011155. Source: OSTI; NTIS; INIS; GPO Dep.

While progress in particle physics may not be as swift as most scientists would like it to be, the data sample presently available has brought us a wealth of new information, all of which appears to cement the Standard Model. This report summarizes the most important results extracted from the many excellent review talks presented at this Symposium. Subject areas addressed here are: properties of neutral and charged leptons; search for rare decays; hadron structure and rare decays; standard model parameters; CP and CPT violation; heavy flavor physics; charm physics; beauty physics; B^0-$\bar{B}^0$ mixing; and unitarity triangle.

24779 (SSCL-SR–1173) **Electroweak and flavor physics: Implications for the SSC. Second annual SSCL spring conference.** Superconducting Super Collider Lab., Waxahachie, TX (United States). [1991]. 1114p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-9105208–Vugraphs: 2. annual superconducting super collider (SSCL) conference on electroweak and flavor physics: implications for the SSC, Waxahachie, TX (United States), 20-23 May 1991). Order Number DE95011027. Source: OSTI; NTIS; INIS; GPO Dep.

This book is a collection of vugraphs for the papers given at the conference. The following topics are covered: neutrino physics and dark matter; solar neutrinos; kaon decays; future prospects in high energy physics (non SSC); bottom quark physics; status and physics aims of SSC; and SSC possibilities for B physics.

In the present work we analyze the process e+e→ bb with the data collected during 1991 and 1992 by the L_3 detector situated in the LEP e+e- storage-ring (CERN). From the measurements of the crossections and the charge asymmetry we determine the parameters of the b quark in the framework of the Standar Model. Finally, we parametrize the possible deviations from the model an obtain upper and lower limits for the mass of the t quark.

24782 (DOE/ER/40561–193) **Finite-temperature corrections in the dilated chiral quark model.** Kim, Y. (Hanyang Univ., Seoul (Korea, Republic of). Dept. of Physics); Lee, Hyun Kyu; Rho, M. Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory. Mar 1995. 18p. Sponsored by USDOE, Washington, DC (United States);Korea Science and Engineering Foundation (Korea, Republic of);Korea Ministry of Education (Korea). DOE Contract FG06-90ER40561. G 94-1400-04-01-3; G bsri-94-2441. Order Number DE95012174. Source: OSTI; NTIS; INIS; GPO Dep.

We calculate the finite-temperature corrections in the dilated chiral quark model using the effective potential formalism. Assuming that the dilaton limit is applicable at some short length scale, we interpret the results to represent the behavior of hadrons in dense and hot matter. We obtain the scaling law, $f_\pi(T)/f_\pi = m_Q(T)/m_Q \simeq m_\sigma(T)/m_\sigma$ while we argue, using PCAC, that pion mass does not scale within the temperature range involved in our Lagrangian. It is found that the hadron masses and the pion decay constant drop faster with temperature in the dilated chiral quark model than in the conventional linear sigma model that does not take into account the QCD scale anomaly. We attribute the difference in scaling in heat bath to the effect of baryonic medium on thermal properties of the hadrons. Our finding would imply that the AGS experiments (dense and hot matter) and the RHIC experiments (hot and dilute matter) will "see" different hadron properties in the hadronization exit phase.

24783 (FNAL/C–95/115-E) **Photon and diphoton production at CDF and D0.** Lamoureux, J.I. (Brandeis Univ., Waltham, MA (United States)). CDF Collaboration; D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–3: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95013237. Source: OSTI; NTIS; INIS; GPO Dep.

Measurements of prompt photon production in $\bar{p}p$ collisions at $\sqrt{s}$ = 1.8 TeV from the CDF and D0 experiments at Fermilab are presented. The measured inclusive isolated photon spectrum at CDF and D0 are used to test current parton distribution functions and NLO QCD predictions. No new resonance is found in the photon + jet mass spectrum from D0 which is consistent with NLO QCD predictions. The pseudorapidity distribution of the leading jet in photon events at CDF is used to constrain the parton distribution sets while the angular distribution is found to be better explained

by a larger Bremsstrahlung contribution. The soft diphoton spectrum is compared to NLO QCD predictions. The diphoton system P_T is found to agree better with the LO shower monte-carlo prediction of Pythia than NLO QCD. Finally, the γ + charm cross section is measured and compared to the LO Pythia prediction.

Major problems of the standard model of strong, weak and electromagnetic interactions, that is to say quantum chromodynamics and the theory of electroweak interactions are considered. 9 figs.

24785 (LA-UR–95-1489) **The rotationally improved Skyrmion, or RISKY.** Dorey, N. (University of Wales, Swansea (United Kingdom). Dept. of Physics); Mattis, M.P. Los Alamos National Lab., NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950293–1: Nuclear and particle physics conference, Seoul (Korea, Republic of), 6-10 Feb 1995). Order Number DE95011993. Source: OSTI; NTIS; INIS; GPO Dep.

The perceived inability of the Skyrme model to reproduce pseudovector pion-baryon coupling has come to be known as the "Yukawa problem." In this talk, we review the complete solution to this problem. The solution involves a new configuration known as the rotationally improved Skyrmion, or "RISKY," in which the hedgehog structure is modified by a small quadrupole distortion. We illustrate our ideas both in the Skyrme model and in a simpler model with a global U(I) symmetry.

24786 (SSCL-Preprint–496) **Light threshold effects in supersymmetric grand unified theories.** Faraggi, A.E. (Weizmann Institute of Science, Rehovot (Israel). Dept. of Physics); Grinstein, B. Superconducting Super Collider Lab., Dallas, TX (United States). Aug 1993. 36p. Sponsored by USDOE, Washington, DC (United States);Sloan (Alfred P.) Foundation, New York, NY (United States);Feinberg School Fellowship (United States). DOE Contract AC35-89ER40486. (WIS–93/61/JULY-PH). Order Number DE95011202. Source: OSTI; NTIS; INIS; GPO Dep.

Supersymmetric Grand Unified Theories have a rich spectrum of particles barely heavier than the intermediate vector bosons. As their non-supersymmetric counterparts, they lead to many relations among low energy observables. But the precise form of the predictions is modified by the extended spectrum. If the masses of these new particles are comparable to M_Z, the standard computation of their effect becomes inaccurate. The authors, present a detailed discussion of the correct procedure, and carry out the relevant computations to one loop order. Attention is paid to the special treatment that the top and Higgs particles must receive. The size of the effect is explored for a range of parameters in the minimal supersymmetric SU(5) grand-unified theory with radiative breaking. It is found that the naive (leading-log) computation can be fairly inaccurate.

This paper is a progress report for the period 1-1-93 to 6-30-95 on a project primarily directed at the application of high energy physics techniques to nuclear structure studies, and the ability to study hadron dynamics through interactions with nuclear targets. This work has included the first legitimate QCD calculations of hard coherent diffractive processes off nucleon (nuclear) targets which established novel features of color transparency phenomenon not anticipated in the previous intuitive or QCD inspired model calculations and predicted the fast increase of the cross section for electroproduction of ρ-mesons with increase of the energy, which was confirmed very recently by the first HERA data on this reaction. First theoretical demonstration that color transparency phenomenon for the hard diffractive processes follow from QCD in the kinematics when both $x \to 0$ and $Q^2 \to \infty$. Establishing the pattern of color (cross section) fluctuations in hadrons. Confirmed by the FNAL inelastic diffraction data. Finding that in realistic quark, skyrmion models of a hadron large momentum transfer elastic lepton-hadron scattering occurs through formation of small spatial size configurations. Discovering a novel class of color transparency sensitive double interaction processes which is complementary to quasielastic reactions originally suggested by S. Brodsky and A. Mueller. Adopting ideas suggested elsewhere for hadron initiated reactions they developed a method for taking into account nuclear correlations in (e,e'p) reactions. Such an approach gives practical possibility to overcome ambiguities of optical model approximation used before and to reliably interpret color transparency effects at intermediate Q^2.

24788 (FNAL/C–95/046-E) **Proton and deuteron structure functions in muon scattering at 470 GeV.** Kotwal, A.V. (Harvard Univ., Cambridge, MA (United States). Dept. of Physics). E665 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–7: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95013587. Source: OSTI; NTIS; INIS; GPO Dep.

The proton and deuteron structure functions F_2^p and F_2^d measured in inelastic muon scattering with an average beam energy of 470 GeV. The data were taken at Fermilab experiment 665 during 1991-1992 using liquid hydrogen and deuterium targets. The F_2 measurements are reported in the range $0.0008 < x < 0.6$ and $0.2 < Q^2 < 75$ GeV^2. These are the first precise measurements of F_2 in the low x and Q_2 range of the data. The E665 data overlap in x with the HERA data, and there is a smooth connection in Q^2 between the two data sets. At high Q^2 the E665 measurements are consistent with QCD-evolved leading twist structure function models. The data are qualitatively described by structure function models incorporating the hadronic nature of the photon at low Q^2. The Q^2 and the W dependence of the data measure the transition in the nature of the photon between a point-probe at high Q^2 and a hadronic object at low Q^2.

Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503147–3: Rencontres de Physique de la Valle' d'Aoste, La Thuile (Italy), Mar 1995). Order Number DE95013002. Source: OSTI; NTIS; INIS; GPO Dep.

The DO collaboration reports on a search for the Standard Model top quark in $p\bar{p}$ collisions at $\sqrt{s} = 1.8$ TeV at the Fermilab Tevatron, with an integrated luminosity of approximately 50 pb^{-1}. We have searched for $t\bar{t}$ production in the dilepton and single-lepton decay channels, with and without tagging of b quark jets. We observe 17 events with an expected background of 3.8 ± 0.6 events. The probability for an upward fluctuation of the background to produce the observed signal is 2×10^{-6} (equivalent to 4.6 standard

deviations). The kinematic properties of the excess events are consistent with top quark decay. We conclude that we have observed the top quark and measure its mass to be 199_{-21}^{+19} (stat.) ± 22 (syst.) GeV/c^2 and its production cross section to be 6.4 $\pm$ 2.2 pb.

24791 (FNAL/C–95/109-E) **Probing pomeron structure at Fermilab.** Melese, P. CDF and D0 Collaborations. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–10: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95014660. Source: OSTI; NTIS; INIS; GPO Dep.

Using the CDF detector, dijet and W production with rapidity gaps has been searched for as evidence for hard-pomeron induced diffraction. Diffractive W's are sensitive to a pomeron with a hard-quark structure, while diffractive dijets are sensitive to both hard-gluon and hard-quark structure. No evidence of diffractive W's has been found down to the few percent level and the fraction of diffractive dijets is measured to be (-0.03 ± 0.37)%, or consistent with zero. The existence of colorless exchange between jets has been confirmed. Both the DO and CDF detectors show a statistically significant excess of dijet events with rapidity gaps between the jets at the level of 1-2% of all dijets.

24792 (FNAL/C–95/144) **A measurement of $\alpha_s(Q^2)$ from the Gross Llewellyn Smith sum rule.** Harris, D.A. (Rochester Univ., NY (United States)); Auchincloss, P.; Arroyo, C.G. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–13: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95014575. Source: OSTI; NTIS; INIS; GPO Dep.

The Gross Llewellyn Smith sum rule has been measured at different values of four-momentum transfer squared (Q^2) by combining the precise CCFR neutrino data with data from other deep-inelastic scattering experiments at lower values of Q^2. A comparison with the O (α_s^3) predictions of perturbative QCD yields a determination of α_s and its dependence on Q^2 in the range $1\text{GeV}^2 < Q^2 < 20\ \text{GeV}^2$. Low Q^2 tests have greater sensitivity to α_s (M_Z^2) than high Q^2 tests, since at low Q^2 α_s is large and changing rapidly.

24793 (FNAL/C–95/150-E) **Rare B decays and time dependent mixing at CDF.** Ragan, K.J. (McGill Univ., Montreal (Canada)). CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–14: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95014573. Source: OSTI; NTIS; INIS; GPO Dep.

We report recent results on rare B decays searches – specifically, the decay modes $B^0 \to \mu^+\mu^-$, $B^0 \to \mu^+\mu^- K^{0*}$, and $B^\pm \to \mu^+\mu^- K^\pm$ – from the CDF collaboration using data from the 1992–1993 run of the Tevatron collider. In addition, we present the first CDF measurement of time dependent $B^0 - \bar{B}^0$ mixing.

24794 (FNAL/C–95/161-E) **Jet correlation studies as a function of rapidity interval at D0.** Heuring, T.C. (Florida State Univ., Tallahassee, FL (United States)). D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9503158–15: 30. Rencontres de Moriond on QCD and high energy interactions, Les Arcs (France), 19-26 Mar 1995). Order Number DE95014713. Source: OSTI; NTIS; INIS; GPO Dep.

During the 1992–93 collider run of the Fermilab Tevatron the D0 experiment accumulated a large sample of events with jets in the final state. Since the D0 detector can trigger on jets over the entire pseudorapidity range $|\eta| < 3.2$, we collected a sample of events containing jets separated by large rapidity intervals. Such events may not be well described by LO or NLO QCD perturbative calculations due to the increased importance of additional gluon radiation which tends to decorrelate the leading jets in the event. These contributions can be included using a leading-log approximation (LLA) where the leading logarithmic terms are resummed calculation of Del Duca and Schmidt. We present the first experimental measurement of jet-jet ϕ correlations as a function of the rapidity interval of the η ordered jets. We compare these results to JETRAD, HERWIG and BFKL resummation predictions.

24800 (LBL–36499) **Photon-photon colliders.** Sessler, A.M. Lawrence Berkeley Lab., CA (United States). Apr 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950512–261: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014869. Source: OSTI; NTIS; INIS; GPO Dep.

Since the seminal work by Ginsburg, et at., the subject of giving the Next Linear Collider photon-photon capability, as well as electron-positron capability, has drawn much attention. A 1990 article by V.I. Teinov describes the situation at that time. In March 1994, the first workshop on this subject was held. This report briefly reviews the physics that can be achieved through the photon-photon channel and then focuses on the means of achieving such a collider. Also reviewed is the spectrum of backscattered Compton photons – the best way of obtaining photons. We emphasize the spectrum actually obtained in a collider with both polarized electrons and photons (peaked at high energy and very different from a Compton spectrum). Luminosity is estimated for the presently considered colliders, and interaction and conversion-point geometries are described. Also specified are laser requirements (such as wavelength, peak power, and average power) and the lasers that might be employed. These include conventional and free-electron lasers. Finally, we describe the R&D necessary to make either of these approaches viable and explore the use of the SLC as a test bed for a photon-photon collider of very high energy.

24801 (SLAC–451, pp. 390-398) **Mixing-induced CP violation in the $D^0\bar{D}^0$ system.** Izen, J.M. (Univ. of Texas, Dallas, TX (United States)). Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. (CONF-9408190–: Tau-Charm factory in the era of B-factories and CESR conference, Stanford, CA (United States), 15-16 Aug 1994). In *The Tau-Charm Factory in the ERA of B-Factories and CESR.* 763p. Order Number DE95007894. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses mixing-induced CP violation which can be studied in the $D^0\bar{D}^0$ system. He reviews work presented in a previous study on Tau Charm Factories for this system. The study is based on the e^+e^- reaction yielding $D^0\bar{D}^0$ and perhaps a gamma or π^0, which decay to a shared final state plus hadronic, or semileptonic, or $l^{\pm}X$, or $K^{\pm}X$. The author also reviews the question of the appropriate CM energy to study this reaction at, based on cross sections and abilities to reject backgrounds.

24802 (SSCL–463) **Total cross sections of beauty and charmed mesons on protons.** Fridman, A. (Paris-7 Univ., 75 (France). Lab. de Physique Nucleaire et Hautes Energies); Meshkov, S. Superconducting Super Collider Lab., Dallas, TX (United States). Jun 1991. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011150. Source: OSTI; NTIS; INIS; GPO Dep.

Using a simple scaling law we predict the values of the total cross sections $\sigma(B\pm p)$, $\sigma B_{d,s}{}^0$, $\sigma(\bar{B}_{d,s}{}^0 P)$, $\sigma(D_{d,s}{}^{\pm} P)$, $\sigma(D^0 p)$, $\sigma(\bar{D}^0 p)$ from known total K_p cross sections. We assume that mesons with the same light valence quark, q, and differing only by their heavy valence quark content, Q, have total cross sections on protons which scale as the inverse of the nth power of the reduced mass of the meson. We predict that $\sigma(Q\bar{q})p > \sigma(\bar{Q}q)p$.

24803 (SSCL-SR–1218) **Coherent production of ε^+ particles in crystal using proton beam from SSC.** Okorokov, V.V. (ITER, Moscow, (Russian Federation)); Dubin, A.Yu. Superconducting Super Collider Lab., Dallas, TX (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011203. Source: OSTI; NTIS; INIS; GPO Dep.

The unique possibilities of the SSC can be ideally used for a new generation of coherent generation experiments with relativistic protons which require 20 Tev energy of the incident beam. The availability of 20 Tev proton beam at SSC allows new experiments on coherent production of ε^+ particle by relativistic proton in crystal. Experiment carried out at low energies can now be extended with protons in very narrow energy region (resonance energy, which easy can be calculated) using the new accelerator facilities at SSC. We propose to study coherent production via the Coulomb field of the cristal atoms to excite the transition $p + \gamma \rightarrow \varepsilon^+$ (1189).

24808 (INS–1079) **New approach to the width of giant dipole resonance in hot nuclei.** Dinh Dang, N.; Sakata, Fumihiko. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Dec 1994. 29p. Order Number DE95789263. Source: OSTI; NTIS; INIS.

A new approach describing the width of the giant dipole resonance (GDR) in hot nuclei is proposed. The GDR is generated by the ph excitations within the finite-temperature RPA (FTRPA), while its damping at finite temperature arises from the anharmonic coupling of ph configurations to the thermal pp and hh ones beyond the FTRPA. A unification of the quantal and thermal spreading widths is undertaken within the framework of motional damping. The numerical calculations are performed by using a schematic

model with equally degenerate equidistant shells for a hot nucleus of mass A = 112 carrying no angular momentum. They give a good agreement with the behavior of the recent experimental data. A possibility of an existence of low-lying mode, to which the GDR collectivity is transferred, and a limiting temperature for the GDR in very hot nuclei are discussed. (author).

Dept. of Physics); Sakata, Fumihiko; Une, Tsutomu; Tanaka, Takeshi; Onoda, Akira. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Dec 1994. 33p. Order Number DE95789264. Source: OSTI; NTIS; INIS.

From the standpoint of the nuclear many-body problem, a possible microscopic description of nuclear collective rotation in the band-crossing region is proposed with the purpose to disclose dynamical interweaving between the particle motion and the collective rotation. According to the theory, a microscopic background of both the 'particle-plus-rotor model' and the 'rotating shell model' is given, and occurrence mechanism of the s-band is clarified. (author).

24811 (LBL–37254) **B^--decay and cosmic-ray half-life of ^{54}Mn.** Kibedi, T. (Australian National Univ., Canberra, ACT (Australia)); Kerr, M.; Dracoulis, G.D.; Byrne, A.P.; Norman, E.B. Lawrence Berkeley Lab., CA (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9508122–3: 24. international cosmic rays conference (ICRC), Rome (Italy), 28 Aug - 8 sep 1995). Order Number DE95014769. Source: OSTI; NTIS; INIS; GPO Dep.

A superconducting solenoid electron spectrometer operated in the lens mode was adapted to search for the β^--decay of ^{54}Mn. The Compton-electron and other instrumental backgrounds have been significantly reduced by special shielding of the absorber system. An improved procedure has been developed to select the events by momenta. A limit of 2.7×10^{-5} has been established for the β^- branch.

24812 (LNF-P–95-015) **Tau decays into kaons.** Finkemeier, M. (Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Lab. Nazionale di Frascati); Mirkes, E. Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Apr 1995. 21p. Order Number DE95789753. Source: OSTI; NTIS (US Sales Only).

Predictions for semi-leptonic decay rates of the τ lepton into two meson final states and three meson final states are derived. The hadronic matrix elements are expressed in terms of form factors, which can be predicted by chiral Lagrangians supplemented by informations about all possible low-lying resonances in the different channels. Isospin symmetry relations among the different final states are carefully taken into account. The calculated brancing ratios are compared with measured decay rates where data are available.

24813 (UCRL-JC–119301) **Decay of the ^{194}Pb superdeformed band.** Brinkman, M.J. (Oak Ridge National Lab., TN (United States)). Lawrence Livermore National Lab., CA (United States). 9 Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9408213–2: Conference on physics from large gamma-ray detector arrays, Berkeley, CA (United States), 2-6 Aug 1994). Order Number DE95011756. Source: OSTI; NTIS; INIS; GPO Dep.

Three experiments using the ^{174}Yb(^{25}Mg,5n) reaction at a beam energy of 130 MeV have been performed utilizing the Early Implementation of GAMMASPHERE. The goal of these experiments was to study the decay of the known superdeformed states in ^{194}Pb to the normal low-lying levels in this nucleus. The statistical decay of these band appears to be suppressed with respect to its ^{194}Hg isobar. A single discrete transition at 2.746(2) MeV in coincidence with both the superdeformed band and the normal states through which it decays has been identified in these experiments. The evidence for this transition and a discussion of its placement will be presented.

24814 (ANL/NDM–132) **Neutron interaction with doubly-magic ^{40}Ca.** Smith, A.B. (Argonne National Lab., IL (United States)). Argonne National Lab., IL (United States). Nov 1993. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013544. Source: OSTI; NTIS; INIS; GPO Dep.

Differential neutron elastic and inelastic-scattering cross sections of elemental calcium (96.94% doubly-magic ^{40}Ca) are measured from $\approx$ 1.5 to 10 MeV with sufficient detail to determine their energy-averaged behavior in the highly fluctuating environment. These results, combined with values previously reported in the literature, are assessed in the contexts of optical-statistical, dispersive optical, and coupled-channels models, applicable to the energy domain 0 $\rightarrow$ 30+ MeV, with particular emphasis on the lower energies where the interpretations are sensitive to the dispersion relationship and the effective mass. The interpretations define the energy dependencies of the potential parameters (resolving prior ambiguities), suggest that previous estimates of the prominent low-energy (n,p) and (n,a) reactions are too large, reasonably describe observables to at least 30 MeV, and provide a vehicle for extrapolation into the bound-state regime that gives a good description of hole- and particle-state binding energies. The resulting real-potential parameters (in contrast to many ^{40}Ca parameters reported in the literature) are shown consistent with global trends.

24815 (CONF-9403151–3) **Thirteen years of pair production.** Strayer, M.R. Oak Ridge National Lab., TN (United States). [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Atomic collisions; Oak Ridge, TN (United States); 3-5 Mar 1994. Order Number DE95013205. Source: OSTI; NTIS; INIS; GPO Dep.

This talk surveys a thirteen-year collaboration with Chris Bottcher on various aspects of strong field electrodynamics. Most of the work centers on the atomic physics associated with the peripheral collisions of ultrarelativistic heavy atoms. The earliest, beginning in about 1979, dealt with the spontaneous emission of positrons from nuclear quasimolecules and touched briefly on the formation of axions as a possible explanation of the anomalous peaks in the spectrum. This work stimulated the extensive studies of particle production from coherent fields that laid the foundations for investigations of nuclear form factors, structure functions, and production mechanisms for the Higgs and other exotic particles. Chris conjectured that the strong fields that are present in these collisions would give rise to nonperturbative effects. Thus, during this time, Chris also worked to develop basis-spline collocation methods for solving dynamical relativistic fermions in super strong fields. This was perhaps one of the best of times for Chris; on these problems alone, he co-authored fifty articles with more than twenty different collaborators.

24816 (CONF-9411185–5) **TNG calculations and evaluations of photon production data for some ENDF/B-VI materials.** Fu, C.Y. Oak Ridge National Lab., TN (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From NEANC specialist's meeting on measurement, calculation, and evaluation of photon production

data; Bologna (Italy); 9-11 Nov 1994. Order Number DE95014264. Source: OSTI; NTIS; INIS; GPO Dep.

Among the new evaluations in the ENDF/B-VI general purpose files, 25 were based on calculations using TNG, a consistent Hauser-Feshbach pre-equilibrium nuclear model code. The photon production cross sections and spectra were calculated simultaneously with the particle emission cross sections and spectra, assuring energy balance for each reaction. The theories used in TNG for these calculations are summarized. Several examples of photon production data, taken from the ENDF/B-VI files, are compared with the available experimental data.

24817 (JAERI-Research–95-010) **Consistent calculations of fast neutron induced fission, (n,2n) and (n,3n) cross-sections for 71 isotopes of Th, Pa, U, Np, Pu, Am, Cm, Bk and Cf.** Konshin, V.A. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1995. 115p. Order Number DE95789301. Source: OSTI; NTIS; INIS.

The neutron cross-sections for fission, (n,2n) and (n,3n) reactions have been calculated consistently for $^{227-234}$Th, $^{229-233}$Pa, $^{230-240}$U, $^{235-239}$Np, $^{236-247}$Pu, $^{239-245}$Am, $^{238-251}$Cm, $^{245-249}$Bk and $^{249-252}$Cf using the Hauser-Feshbach statistical model code STAPRE. The main parameter of the pre-equilibrium exciton model was tested against the experimental data for the secondary neutron spectra for ^{238}U. Shell, superfluid and collective effects in nuclear level density have been taken into account. Neutron transmission coefficients were calculated using the coupled-channel code ECIS. All experimental data available for fission and (n,2n) reactions for the above isotopes have been used for model testing. Due to a lack of experimental data for the majority of the nuclei considered theoretical prediction of neutron cross-sections has been made. (author).

(CONF-9409242–3: CORINNE 2: international conference on multiparticles correlation and particle production in nucleus-nucleus collisions, Nantes (France), 5-9 Sep 1994). Order Number DE95011279. Source: OSTI; NTIS; INIS; GPO Dep.

We demonstrate that in the Quantum Molecular Dynamics model, dynamical correlations can result in the production rate for final state nucleon clusters (and hence composite fragments) being higher than would be expected if statistics and the available phase space were dominant in determining composite formation. An intranuclear cascade or a Boltzmann-Uehling-Uhlenbeck model, combined with a statistical approach in the late stage of the collision to determine composites, provides an equivalent description only under limited conditions of centrality and beam energy. We use data on participant fragment production in Au + Au collisions in the Bevalac's BOS time projection chamber to map out the parameter space where statistical clustering provides a good description. In particular, we investigate momentum-space densities of fragments up to ^{4}He as a function of fragment transverse momentum, azimuth relative to the reaction plane, rapidity, multiplicity and beam energy.

24826 (LBL–37201) **Radioisotope yields from 1.85-GeV protons on Mo and 1.85- and 5.0-GeV protons on Te.** Bardayan, D.W. (Tennessee Technological Univ., Cookevill, TN (United States)); Hindi, M.M.; Barghouty, A.F. Lawrence Berkeley Lab., CA (United States); Tennessee Technological Univ., Cookeville, TN (United States). Dept. of Physics. May 1995. 4p. Sponsored by USDOE, Washington, DC (United States);Fundacao de Amparo a Pesquisa do Estado de Sao Paulo (FAPESP), SP (Brazil). DOE Contract AC03-76SF00098 ; FG05-87ER40314. (CONF-9508122–2: 24. international cosmic rays conference (ICRC), Rome (Italy), 28 Aug - 8 sep 1995). Order Number DE95014871. Source: OSTI; NTIS; INIS; GPO Dep.

Radioisotope yields from 1.85-GeV proton interactions in a natural isotopic composition Mo target and those from 1.85- and 5.0-GeV protons in natural Te targets were measured at Lawrence Berkeley Laboratory's Bevatron. The radioisotope yields were determined by γ-counting the targets using a 100-cm^3 coaxial Ge detector following the irradiations. Cross sections were determined for the production of 31 radioactive nuclides, ranging from Z = 35, A = 74, to Z = 43, A = 97, from the Mo target and for 47 radioactive nuclides, ranging from Z = 35, A = 75, to Z = 53, A = 130 from the Te targets.

24827 (SAND–95-1338C) **Further development of the ion cross section for single event upset: model (HICUP).** Connell, L.W.; Sexton, F.W.; Prinja, A.K. Sandia National Labs., Albuquerque, NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9507137–1: Institute of Electrical and Electronics Engineers (IEEE) transactions on nuclear science: NSRE conference, Madison, WI (United States), 12 Jul 1995). Order Number DE95014866. Source: OSTI; NTIS; INIS; GPO Dep.

The HICUP models are shown to be useful tools for both analyzing cross section data and performing upset rate calculations, thereby allowing the cross section concept to be used in both areas. The angular dependent HICUP model is developed from the RPP geometry and the Weibull density function. It is compared with angular cross section data, showing good agreement. The HICUP model is used to derive the correct scaling laws for transforming cross section data taken off-normal to normal incidence. The HICUP scaling reconciles two previously proposed inverse cosine scaling corrections which are shown to be asymptotic forms of the HICUP scaling. The angle-integrated form, I-HICUP, is developed and used in Galactic Cosmic Ray (GCR) upset rate calculations on several devices. Results are nearly identical to SPACE RADIATION™ calculations. I-HICUP is used to perform an uncertainty analysis of GCR upset rate, examining the sensitivity to uncertainties in the input parameters. The GCR upset rate shows the greatest sensitivity to upset threshold, device depth (and funnel depth if applicable), and saturation cross section, the least sensitivity to RPP length-to-width aspect ratio. The other Weibull parameters, width, W, and shape, b, are of intermediate sensitivity.

Texas Engineering Experiment Station. [1992]. 8p. Sponsored by USDOE, Washington, DC (United States);Texas State Government, Austin, TX (United States). DOE Contract FG02-90ER13031. Grant 010366-183. Order Number DE95014929. Source: OSTI; NTIS; GPO Dep.

Purpose is to use information-based complexity to analyze the degree of optimality of nodal methods for both diffusion and (neutron) transport theory, and to compare these methods to finite difference and finite element methods. Results suggest that information-based complexity theory has potential for comparison of alternative spatial approximations in transport theory.

24829 (ENEA-RT-ERG–94-21) **Benchmarking of code MCNPE-BO.** Guaraldi, R. (ENEA, Bologna (Italy). Area Energia Ambiente e Salute); Padoani, F. ENEA, Bologna (Italy). Area Energia Ambiente e Salute. Nov 1994. 37p. Order Number DE95789772. Source: OSTI; NTIS (US Sales Only).

Following the implementation of an electron transport capability based on a new multi-scattering model, underpinned by the Moliere theory, in MCNP, the new code MCNPE-BO was extensively benchmarked by comparison with other codes and particularly with experimental results. Benchmarks were made to assess the response of the code in problems of energy deposition in homogeneous and inhomogeneous media, forward and backward angular distribution, energy spectra, backscattering, interfaces and absorbed dose. Particular importance has been given to the comparison with results from MCNP4, where the electron transport is based on the Goudsmit-Saunderson theory. The conclusion is that MCNPE-BO is a valid aid in dosimetric problems, being robust and reliable in the tested fields. Though MCNPE-BO results are better than MCNP4 results in some fields, the CPU time spent per particle by MCNPE-BO is slightly higher. Work is in progress to overcome this problem.

24830 (LS–165) **Stopping power and scattering angle calculations of charged particle beams through thin foils.** Nassiri, A. Argonne National Lab., IL (United States). Mar 1991. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015216. Source: OSTI; NTIS; INIS; GPO Dep.

It is important to understand the effects of introducing foils into the path of charged particle beams. In the APS linac system, the intention is to insert thin foils before and after the positron generating target to protect the accelerating structures immediately before and after the target. Electron beams that pass through a dense material lose energy in collisions with the atomic electrons. The scattering path of electrons is much less straight than that of heavier particles (mu, pi meson, K meson, proton, etc.). After a short distance electrons tend to diffuse into the material, rather than proceeding in a rectilinear path.

The current publicly released version of the Integrated TIGER Series (ITS), Version 3.0, has been widely distributed both domestically and internationally, and feedback has been very positive. This feedback as well as our own experience have convinced us to upgrade the system in order to honor specific user requests for new features and to implement other new features that will improve the physical accuracy of the system and permit additional variance reduction. This presentation we will focus on components of the upgrade that (1) improve the physical model, (2) provide new and extended capabilities to the three-dimensional combinatorial-geometry (CG) of the ACCEPT codes, and (3) permit significant variance reduction in an important class of radiation effects applications.

24835 (UCRL-JC–117020) **Inner-shell photo-ionized X-ray laser schemes for low-Z elements.** Moon, S.J. (Lawrence Livermore National Lab., CA (United States)); Eder, D.C.; Strobel, G.L. Lawrence Livermore National Lab., CA (United States). 21 Oct 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940592–13: 4. international colloquium on X-ray lasers, Williamsburg, VA (United States), 16-20 May 1994). Order Number DE95014697. Source: OSTI; NTIS; INIS; GPO Dep.

Gain calculations for inner-shell photo-ionized lasing in C at 45 Å are performed. An incident x-ray source represented by a 150 eV blackbody with a rise time of 50 fsec gives a gain of order 10 cm^{-1}. The x-ray source and thus the driving optical laser requirements are significantly reduced as compared to what is needed for Ne at 15 Å. The authors expect that existing ultra-short pulse lasers can produce the required x-ray source and thus produce a table-top x-ray laser at 45 Å.

24836 (BNL–61928) **Quantum phase space theory for the calculation of v·j vector correlations.** Hall, G.E. (Brookhaven National Lab., Upton, NY (United States). Dept. of Chemistry). Brookhaven National Lab., Upton, NY (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950793–5: 40. annual meeting of the Society of Photo-Optical Instrumentation Engineers: international symposium on optical science, engineering and instrumentation, San Diego, CA (United States), 9-14 Jul 1995). Order Number DE95014450. Source: OSTI; NTIS; INIS; GPO Dep.

The quantum state-counting phase space theory commonly used to describe barrierless dissociation is recast in a helicity basis to calculate photofragment v·j correlations. Counting pairs of fragment states with specific angular momentum projection numbers on the relative velocity provides a simple connection between angular momentum conservation and the v·j correlation, which is not so evident in the conventional basis for phase space state counts. The upper bound on the orbital angular momentum, l, imposed by the centrifugal barrier cannot be included simply in the helicity basis, where l is not a good quantum number. Two approaches for a quantum calculation of the v·j correlation are described to address this point. An application to the photodissociation of NCCN is consistent with recent classical phase space calculations of Cline and Klippenstein. The observed vector correlation exceeds the phase space theory prediction. The authors take this as evidence of incomplete mixing of the K states of the linear parent molecule at the transition state, corresponding to an evolution of the body-fixed projection number K into the total helicity of the fragment pair state. The average over a thermal distribution of parent angular momentum in the special case of a linear molecule does not significantly reduce the v·j correlation below that computed for total J = 0.

24837 (DOE/ER/14402–7) **Spectroscopy at metal cluster surfaces. Annual report, Year 2.** Duncan, M.A. Georgia Univ., Athens, GA (United States). Dept. of Chemistry. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-93ER14402. Order Number DE95015513. Source: OSTI; NTIS; INIS; GPO Dep.

The focus of our research program is the study of gas phase metal clusters to evaluate their potential to model fundamental interactions present on metal surfaces. To do this, we characterize the chemical bonding present between the component atoms in metal clusters as well as the bonding exhibited by "physisorption" on cluster surfaces. Electronic spectra, vibrational frequencies and bond neutral and ionized clusters with a variety of laser/mass spectrometry techniques. We are particularly interested in bimetallic cluster systems, and how their properties compare to those of corresponding pure metal clusters.

Electron energy spectra for H^- autodetaching states resulting from collisions H^- with He at 1 keV are rigorously calculated by including couplings between doubly excited states and continuum states and their interference with direct detachment processes. An energy sampling procedure, based on the Gauss quadratures, is used to discretize continuum states. The present theoretical result, for the first time, clarifies mechanisms of excitation to doubly excited states, quantitatively reproduces the experimental spectra first observed by Risley and Geballe in 1974, separates the contributions from each of three autodetaching states, and identifies the cause of the interference between autodetaching and direct-detaching excitation channels.

The relaxation of vibrationally excited pyrazine (E=40,640 cm^{-1}) by collisions which populate the high J tail (J=58-82) of the vibrationless ground state (00^00) of CO_2 has been studied using tunable infrared diode lasers to probe the scattered CO_2 molecules. The nascent rotational populations and translational recoil velocities for a series of rotational states in the high J tail of the 00^00 level of CO_2 were measured at five collision cell temperatures: 243, 263, 298, 339, and 364 K. Both the rate constants describing these V-R/T processes and the translational temperatures describing the recoiling CO_2 molecules exhibit a very weak positive temperature dependence indicating that the high energy CO_2 molecules must originate from near the center of the pre-collision energy distribution. Quantitative estimates of the actual amount of energy transferred in collisions between CO_2 and vibrationally excited

pyrazine, based on an angular momentum and translational energy exponential gap model of the cross section, indicate that ΔE_{total} can be as large as 7090 cm^{-1} (~20 kcal/mol). These experiments offer compelling evidence that these energy transfer events can indeed be classified as supercollisions since they involve unusually large, single collision energy transfer magnitudes; and despite their relative infrequency, they play a most important role in the collisional deactivation of vibrationally excited pyrazine by a CO_2 bath.

Considerable progress has been made on several problems mentioned in the original proposal and in last year's progress report. Our work is also going in some new directions. The primary focus is still on Immersed Interface Methods (IIM's) for high order accuracy of interface problems on Cartesian grids, but the investigators have also been involved in other projects. In particular, LeVeque's work on clawpack described below has been supported in part by these grants and has been used in direct connection with IIM's in projects in both groundwater flow and acoustics.

24848 (LBL-PUB–754, pp. 203-210) **Simple surface structure determination from Fourier transforms of angle-resolved photoemission extended fine structure.** Zheng, Y. (Pennsylvania State Univ., University Park, PA (United States)); Shirley, D.A. Lawrence Berkeley Lab., CA (United States). Feb 1995. DOE Contract AC03-76SF00098. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

The authors show by Fourier analyses of experimental data, with no further treatment, that the positions of all the strong peaks in Fourier transforms of angle-resolved photoemission extended fine structure (ARPEFS) from adsorbed surfaces can be explicitly predicted from a trial structure with an accuracy of about $\pm$ 0.3 Å based on a single-scattering cluster model together with the concept of a strong backscattering cone, and without any additional analysis. This characteristic of ARPEFS Fourier transforms can be developed as a simple method for determining the structures of adsorbed surfaces to an accuracy of about $\pm$ 0.1 Å.

24849 (SAND–95-1201) **Trapping of radiation in plasmas.** Riley, M.E.; Alford, W.J. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015062. Source: OSTI; NTIS; GPO Dep.

The authors analyze the problem of radiation trapping (imprisonment) by the method of Holstein. The process is described by an integrodifferential equation which shows that the effective radiative decay rate of the system depends on the size and the shape of the active medium. Holstein obtains a global decay rate for a particular

geometry by assuming that the radiating excited species evolves into a steady state spatial mode. The authors derive a new approximation for the trapped decay which has a space dependent decay rate and is easy to implement in a detailed computer simulation of a plasma confined within an arbitrary geometry. They analyze the line shapes that are relevant to a near-atmospheric-pressure mixture of He and Xe. This line-shape analysis can be utilized in either the Holstein formulae or the space-dependent decay approximation.

24850 (UCRL-JC–115959) **Laser-induced fluorescence diagnostic for the LEM turbulent hydrodynamics experiment.** Remington, B.; Dimonte, G. Lawrence Livermore National Lab., CA (United States). Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941174–1: Meeting of the Fluid Dynamics Division of the American Physical Society, Atlanta, GA (United States), 20-22 Nov 1994). Order Number DE95014698. Source: OSTI; NTIS; INIS; GPO Dep.

The authors are developing a laser-induced fluorescence (LIF) diagnostic for the LEM experiment to measure the evolution of a Rayleigh-Taylor unstable fluid interface into the highly nonlinear regime. The interface will be between two fluids of different density in a 7 x 7 x 14 cm cell that will be accelerated downwards over a distance of ~100 cm, achieving maximum velocities of order 50 m/s. One of the two fluids will be doped with laser dye and pumped to fluoresce with a 100 Hz pulsed, frequency doubled YAG laser beam spread into a sheet and entering the cell from the bottom. The short pulse duration of the laser (<10 ns) eliminates motional blurring, and the images are recorded from the side with a series of 35 mm static cameras. Aligning the laser sheet to the center of the cell localizes the region of the cell probed and eliminates edge effects in the data. This LIF diagnostic will be described.

The theoretical approach based on the Boltzman-Langevin model is applied to study the thermal properties of the excitation phenomena in condensed matter. This approach making use of the advantages of the thermodynamic Green's function method provides a tool for the self-consistent description of the many-body correlations. It is demonstrated that such a correlation modifies significantly the excitation strength properties of the electron gas. The resonant thermal effects in electron bulk excitation accompanying a radioactive decay in solids are discussed.

24852 (SAND–94-2468C) **Energy dispersive X-ray reflectivity characterization of semiconductor heterostructures and interfaces.** Chason, E. (Sandia National Labs., Albuquerque, NM (United States)); Mayer, T.M.; Krstelj, Z.M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950117–5: Workshop on semiconductor characterization, Gaithersburg, MD (United States), 30 Jan - 2 feb 1995). Order Number DE95014603. Source: OSTI; NTIS; GPO Dep.

Energy dispersive X-ray reflectivity is a versatile tool for analyzing thin film structures. Layer thickness, interface roughness and composition can be determined with a single non-destructive measurement. Use of energy dispersive detection enables spectra to be acquired in less than 500 s with a rotating anode X-ray generator, making the study of kinetics possible.

Diamond and diamond-like carbon (DLC) have properties which in principle make them ideally suited to a wide variety of thin-film applications. Their widespread use as thin films, however, has been limited for a number of reasons related largely to the lack of understanding and control of the nucleation and growth processes. Real-time, in situ studies of the surface of the growing diamond film are experimentally difficult because these films are normally grown under a relatively high pressure of hydrogen, and conventional surface analytical methods require an ultrahigh vacuum environment. It is believed, however, that the presence of hydrogen during growth is necessary to stabilize the corrugated diamond surface structure and thereby prevent the formation of the graphitic phase. Pulsed ion beam-based analytical methods with differentially pumped ion sources and particle detectors are able to characterize the uppermost atomic layer of a film during growth at ambient pressures 5-7 orders of magnitude higher than other surface-specific analytical methods. We describe here a system which has been developed for the purpose of determining the hydrogen concentration and bonding sites on diamond surfaces as a function of sample temperature and ambient hydrogen pressure under hot filament CVD growth conditions. It is demonstrated that as the hydrogen partial pressure increases, the saturation hydrogen coverage of the surface of a CVD diamond film increases, but that the saturation level depends on the atomic hydrogen concentration and substrate temperature.

24854 (ANL/CHM/CP–86330) **Femtosecond laser postionization of sputtered and laser desorbed atoms.** Pellin, M.J.; Lykke, K.R.; Calaway, W.F. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9504169–1: 4. international workshop on postionization techniques in surface analysis (PITSA), Burgenland (Austria), 23-27 Apr 1995). Order Number DE95012273. Source: OSTI; NTIS; GPO Dep.

This paper examines the photoionization efficiency of a femtosecond laser ionization source on several atomic species. Use of femtosecond laser ionization pulses to photoionize the desorbing flux from a sample surface is examined. Example of mass spectra produced is given using 248 nm pulse on sputtered Au. Al and Mo have widely different ionization potentials and show that 248 nm pulses are more efficient at photoionization than longer wavelengths; this is enhanced for Mo with high ionization potential. It is concluded that efficient photoionization occurs for atoms with ionization potentials low enough for two-photon ionization to occur.

24855 (ANL/MSD/CP–82694) **Paramagnetism and reentrant behavior in quasi-1D superconductors at high magnetic fields.** Se de Melo, C.A.R. Argonne National Lab., IL (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505186–3: 2. physical phenomena at high magnetic fields conference, Tallahassee, FL

(United States), 6-9 May 1995). Order Number DE95013755. Source: OSTI; NTIS; INIS; GPO Dep.

The thermodynamics of quasi-one-dimensional superconductors in the presence of large magnetic fields is studied. When the quantum effects of the magnetic field are taken into account, several reentrant phases persist at very high fields. In the last reentrant phase, the free energy, the specific heat jump and the excess magnetization are estimated near the critical temperature. In particular, the excess magnetization is found to be paramagnetic as opposed to diamagnetic (in weak fields) and its sign is found to be controlled by the slope of H_{c2}. This result is further generalized to the entire phase diagram (including all quantum phases) and to different physical systems using general thermodynamic relations which show that the sign of the excess magnetization ΔM near $H_{c2}(T)$ follows $dH_{c2}(T)/dT$. These relations provide a scenario for the evolution of the sign of ΔM from weak fields to strong fields.

24856 (CONF-941013–49) **Performance of pancake coils of parallel co-wound Ag/BSCCO tape conductors in static and ramped magnetic fields.** Schwenterly, S.W. (Oak Ridge National Lab., TN (United States)); Lue, J.W.; Lubell, M.S.; Walker, M.S.; Hazelton, D.W.; Haldar, P.; Rice, J.A.; Hoehn, J.G. Jr.; Motowidlo, L.R. Oak Ridge National Lab., TN (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Applied superconductivity conference; Boston, MA (United States); 16-21 Oct 1994. Order Number DE95013045. Source: OSTI; NTIS; INIS; GPO Dep.

Critical Currents are reported for several Ag/BSCCO single-pancake coils in static magnetic fields ranging from 0 to 5 T and temperatures from 4.2 K to 105 K. The sample coils were co-wound of one to six tape conductors in parallel. Since the closed loops formed in such an arrangement could lead to eddy current heating or instability in changing fields, one of the coils was also tested in helium gas, in fields ramped at rates of up to 1.5 T/s. For these quasi-adiabatic tests, at each temperature the transport current was set just below the critical value for a preset static field of 3.3 or 4.9 T. The field was then rapidly ramped down to zero, held for 20 sec, and then ramped back up to the original value. The maximum observed temperature transient of about 1.7 K occurred at 9 K, for a field change of 4.75 T. The temperature transients became negligible when the sample was immersed in liquid helium. Above 30 K, the transients were below 1 K. These results give confidence that parallel co-wound HTSC coils are stable in a rapidly-ramped magnetic field, without undue eddy current heating.

24857 **Epitaxial $SrRuO_3$ films.** Wu, Xin Di; Muenchausen, R. 1993. Filed date 2 Apr 1993. U.S. Patent Application 8-042,209. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015104. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Disclosed is an epitaxial oriented thin film of an alkaline earth metallic oxide selected from $SrRuO_3$, $CaRuO_3$, $BaRuO_3$, or mixed alkaline earth ruthenium trioxides thereof is provided. A S-N-S junction device including a substrate, a first portion of a superconducting copper oxide in contact with the substrate, a portion of an alkaline earth metallic oxide in contact with the first portion of a superconducting copper oxide, and, a second portion of a superconducting copper oxide in contact with the portion of an alkaline earth metallic oxide, but separated from the first portion of superconducting copper oxide is also provided as well as a ferroelectric device including a substrate, a first portion of an alkaline earth metallic oxide upon the substrate, a portion of a ferroelectric material upon the first portion of an alkaline earth metallic oxide, and, a portion of a conductive material of a material selected from the group consisting of platinum metal or an alkaline earth metallic oxide upon the portion of ferroelectric material. Finally, an improvement in a process for the preparation of an electronic component including deposition of a first material portion, deposition of a patterned second material portion upon the first material portion, said second material portion chemically resistant to subsequent chemical etching by a dilute acid, and subsequent chemical etching by a dilute acid of the first material portion uncovered by the patterned second material portion, wherein the improvement includes using an alkaline earth metallic oxide selected from the group consisting of $SrRuO_3$, $CaRuO_3$, $BaRuO_3$, or mixed alkaline earth ruthenium trioxides thereof as the second material portion chemically resistant to subsequent chemical etching by a dilute acid is provided.

70 PLASMA PHYSICS AND FUSION

24858 (DOE/SF/19460–58) **LLE review. Volume 61, Quarterly report, October–December 1994.** Rochester Univ., NY (United States). Lab. for Laser Energetics. [1994]. 58p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract FC03-92SF19460. Contract DAAL03-92-G-0147. Order Number DE95012914. Source: OSTI; NTIS; INIS; GPO Dep.

This volume of the LLE review, covering the period of October–December 1994, contains articles on a diagnostic method employing krypton spectroscopy for measurement of temperature and shell-fuel mixing in high-temperature implosions; the first direct assessment of the ion-acoustic decay instability in a large-scale length, hot plasma; measurements of polarization mode dispersion and group-velocity walkaway in birefringent media using a frequency domain interferometer; an evaluation of the magnetic flux dynamics occurring in an optically triggered, thin-film superconducting switch; the effect of slurry fluid chemistry on particle size distribution during aqueous polishing of optical glass; and the influence of thermal and mechanical processing history in the preparation of well-ordered liquid crystal elastomer systems.

Two numerical codes are combined to give a theoretical estimate of the current drive and direct electron heating by fast waves launched from phased antenna arrays on the DIII-D tokamak. Results are compared with experiment.

24860 (DOE/ER/53198–261) **High current plasma electron emitter.** Fiksel, G. (and others); Almagri, A.F.; Craig, D. Wisconsin Univ., Madison, WI (United States). Plasma Physics Research. Jul 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER53198. Order Number DE95015953. Source: OSTI; NTIS; INIS; GPO Dep.

A high current plasma electron emitter based on a miniature plasma source has been developed. The emitting plasma is created by a pulsed high current gas discharge. The electron emission current is 1 kA at 300 V at the pulse duration of 10 ms. The prototype injector described in this paper will be used for a 20 kA electrostatic current injection experiment in the Madison Symmetric Torus (MST) reversed-field pinch. The source will be replicated in order to attain this total current requirement. The source has a simple design and has proven very reliable in operation. A high emission current, small size (3.7 cm in diameter), and low impurity generation make the source suitable for a variety of fusion and technological applications.

In the year just past, the authors made major progress in understanding turbulence and transport in both core and edge. Development of the capability for turbulence measurements throughout the poloidal cross section and intelligent consideration of the observed asymmetries, played a critical role in this work. In their confinement studies, a limited plasma with strong, H-mode-like characteristics serendipitously appeared and received extensive study though a diverted H-mode remains elusive. In the plasma edge, they appear to be close to isolating a turbulence drive mechanism. These are major advances of benefit to the community at large, and they followed from incremental improvements in diagnostics, in the interpretation of the diagnostics, and in TEXT itself. Their general philosophy is that the understanding of plasma physics must be part of any intelligent fusion program, and that basic experimental research is the most important part of any such program. The work here demonstrates a continuing dedication to the problems of plasma transport which continue to plague the community and are an impediment to the design of future devices. They expect to show here that they approach this problem consistently, systematically, and effectively.

24863 (DOE/ET/53088–701) **Revisit to self-organization of solitons for dissipative Korteweg-de Vries equation.** Kondoh, Y.; Van Dam, J.W. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Mar 1995. 15p. Sponsored by USDOE, Washington, DC (United States);JIFT Program (United States). DOE Contract FG05-80ET53088. (IFSR–701). Order Number DE95009556. Source: OSTI; NTIS; INIS; GPO Dep.

The process by which self-organization occurs for solitons described by the Korteweg-de Vries (KdV) equation with a viscous dissipation term is reinvestigated theoretically, with the use of numerical simulations in a periodic system. It is shown that, during nonlinear interactions, two basic processes for the self-organization of solitons are energy transfer and selective dissipation among the eigenmodes of the dissipative operator. It is also clarified that an important process during nonlinear self-organization is an interchange between the dominant operators, which has hitherto been overlooked in conventional self-organization theories and which leads to a final self-similar coherent structure determined uniquely by the dissipative operator.

24864 (GA-A–22048) **Experimentally determined profiles of fast wave current drive on DIII-D.** Forest, C.B. (General Atomics, San Diego, CA (United States)); Petty, C.C.; Baity, F.W. General Atomics, San Diego, CA (United States); Oak Ridge National Lab., TN (United States); Lawrence Livermore National Lab., CA (United States). Jun 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ; AC05-84OR21400 ; W-7405-ENG-48. (CONF-9505105–3: 11. topical conference on radio frequency in plasmas, Palm Springs, CA (United States), 17-19 May 1995). Order Number DE95015359. Source: OSTI; NTIS; INIS; GPO Dep.

Profiles of non-inductive current driven by fast waves have been determined for reversed-shear DIII-D discharges. Both the current profile and toroidal electric field profile are determined from time sequences of equilibrium reconstructions. Using this information, the measured current profile has been separated into inductive and non-inductive portions. By comparing similar fast wave power, the portion of the total non-inductive current driven by fast waves were determined. The experimentally determined profiles of FWCD are in general agreement with theoretical predictions. Specifically, 135 kA was driven by 1.4 MW of rf power with a profile peaked inside $\rho = 2$.

24865 (GA-A–22062) **Interaction of fast waves with ions.** Chiu, S.C. (and others); deGrassie, J.S.; Harvey, R.W. General Atomics, San Diego, CA (United States). Jun 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-9505105–1: 11. topical conference on radio frequency in plasmas, Palm Springs, CA (United States), 17-19 May 1995). Order Number DE95014669. Source: OSTI; NTIS; INIS; GPO Dep.

To fully utilize the available power sources in DIII-D (FW, NBI, ECH), understanding of the synergism between the heating mechanisms is important. In this paper the ion distribution, under simultaneous application of NBI and FW, is calculated from Fokker-Planck code CQL3D coupled to ray-tracing code CURRAY. It is found that interaction between energetic ions and FW can be minimized or maximized by adjusting various parameters such as magnetic field, density, beam energy, and FW frequency. Specifically, in DIII-D, the authors find negligible interactions above 1.8 T and above 80 MHz, while the interaction increases at lower fields and frequencies. The results are compared with experiments in DIII-D including the calculated neutron rate. Energetic ion orbit losses may play an important role in the ion distribution, and this effect is being investigated.

24866 (JAERI-Review–95-003) **Review of 'cold fusion'.** Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 98p. (In Japanese). Order Number DE95789285. Source: OSTI; NTIS; INIS.

This review describes the results from the following works: (1) to overview the chronological history of 'cold fusion' including the International Conferences on cold fusion (ICCF-3 and ICCF-4), (2) to overview the various theories which can explain the 'cold fusion' phenomena, (3) to overview the current status of the experiments to produce anomalous excess heat by electrolysis with palladium electrodes, (4) to explain the excess heat phenomena on the basis of chemical heat in hydrogen dissolution to palladium alloys, (5) to check the possibility of multi-body fusion reactions in hydrogen-absorbed palladium alloys, and (6) to overview newly-proposed ideas to realize nuclear fusion in smaller devices than the magnetic or laser fusion devices. JAERI presented a view that 'cold fusion' using electrolysis with palladium electrodes seemed to show no evidence of nuclear fusion, in the journal of 'Genshiryoku-Kogyo (in Japanese)'. As a result from this review, JAERI confirms to reach almost the same conclusion as the previously-stated view, while the ideas or experiments to achieve nuclear fusion without contradiction against the knowledge of physics and using small-scale devices should be encouraged. 24867 (NIFS–329) **A model of sawtooth based on the transport catastrophe.** Itoh, K.; Itoh, S.; Fukuyama, A. National Inst. for Fusion Science, Nagoya (Japan). Dec 1994. 26p. Order Number DE95789307. Source: OSTI; NTIS; INIS.

A new model of the sawtooth, which is not triggered by the m=1 helical mode, is proposed. The catastrophic change of the transport coefficient is predicted in the central region, where the safety factor q is lower than unity. The magnetic component in fluctuation increases as the plasma pressure increases. If the pressure gradient exceeds a certain threshold, a magnetic stochasticity sets in. The electron thermal conductivity can be enhanced by the factor of the ion-to-electron mass ratio, leading to the rapid flattening of the electron pressure profile. The enhanced transport coefficient also happens for ions. The increment of the transport associated with the strong magnetic perturbation continues until the ion pressure profile is flattened. Hysteresis behaviour of transport flux to the pressure gradient is obtained. The current profile is influenced by the enhanced current diffusivity from the same mechanism, but the change of the q profile remains small. Simple model equations which follow the dynamics are introduced. The dynamic solution of sawtooth crash is simulated. (author).

24868 (NIFS–330) **Launching conditions for electron cyclotron heating in a sheared magnetic field.** Nagasaki, K. (Kyoto Univ., Uji (Japan). Plasma Physics Lab.); Ejiri, A. National Inst. for Fusion Science, Nagoya (Japan). Jan 1995. 22p. Order Number DE95789308. Source: OSTI; NTIS; INIS.

Launching conditions for an electron cyclotron wave in a plasma with a sheared magnetic field are studied. One dimensional second order coupled equations are solved for the ordinary and extraordinary modes. It is shown that for wave absorption, the rotation angle and ellipticity of the wave should be determined by taking into account the effect of the sheared magnetic field, particularly in heliotron/torsatron configurations. Launching conditions for effective

heating are obtained for second harmonic extraordinary-mode heating in the Heliotron-E, CHS and LHD helical devices. (author).

24869 (NIFS–331) **An advanced electrostatic particle simulation algorithm for implicit time integration.** Watanabe, T.H.; Todo, Y.; Horiuchi, R.; Watanabe, K.; Sato, T. National Inst. for Fusion Science, Nagoya (Japan). Jan 1995. 29p. Order Number DE95789312. Source: OSTI; NTIS; INIS.

We have developed an advanced electrostatic macro-scale implicit particle simulation code (AMACS-ES), which enables us to simulate low-frequency plasma wave phenomena with large spatial scale length. Especially, the Poisson's equation with the implicit susceptibility term is accurately solved in our algorithm. Linear properties of the simulation code based on this algorithm, such as the linear stability and the dispersion relation, are examined. We have also applied our simulation code to the excitation and nonlinear saturation of the ion temperature gradient (ITG) drift instability in a system with a shearless slab geometry. The linear properties of the excited ITG mode are compared with the theoretical prediction to find a good agreement. (author).

24870 (NIFS–332) **Bifurcations from periodic solution in a simplified model of two-dimensional magnetoconvection.** Bekki, N. (Nihon Univ., Koriyama, Fukushima (Japan). Coll. of Engineering); Karakisawa, T. National Inst. for Fusion Science, Nagoya (Japan). Jan 1995. 84p. Order Number DE95789306. Source: OSTI; NTIS; INIS.

We study a two-dimensional Boussinesq fluid with the nonlinear interaction between the Rayleigh-Benard convection and an externally imposed magnetic field. We introduce a simplified model of fifth-order system of nonlinear ordinary differential equations with five parameters and integrate it numerically in some parameter regions. We find various types of bifurcations from periodic solutions: period-doubling bifurcation, heteroclinic bifurcation, intermittency and abnormal transition to chaos. We also derive a normal form equation from our fifth-order system, applying the center manifold theory to it, and give an expression for the renormalized Holmes-Melnikov boundary to evaluate numerical results. By means of the normal form equation, we show that each property of the two phase portraits described by the Duffing equation and the van der Pol equation emanates from one common attractor in the five-dimensional space of the fifth-order system. (author).

24871 (NIFS–333) **Theory of anomalous transport in reverse field pinch.** Itoh, K.; Itoh, S.; Yagi, M.; Fukuyama, A. National Inst. for Fusion Science, Nagoya (Japan). Jan 1995. 16p. Order Number DE95789309. Source: OSTI; NTIS; INIS.

The transport coefficient for the magnetized plasma, which has been obtained by use of the method of self-sustained turbulence, is applied to the reverse field pinch (RFP). The dependence $\beta_p \propto n^{3/4}/I_p$ is obtained (β_p: plasma pressure divided by the poloidal magnetic pressure, n: plasma density and I_p: plasma current). This result gives an explanation of the experimental observation of the RFP scaling, $\beta_p \propto n/I_p$. The theory of anomalous transport unifies the L-mode scaling laws in the tokamaks, stellarators and heliotron/torsatron as well as RFP. (author).

24872 (NIFS–334) **Application of grating polarizer to 106.4GHz ECH system on Heliotron-E.** Nagasaki, K. (Kyoto Univ., Uji (Japan). Plasma Physics Lab.); Isayama, A.; Ejiri, A. National Inst. for Fusion Science, Nagoya (Japan). Jan 1995. 31p. Order Number DE95789310. Source: OSTI; NTIS; INIS.

A grating polarizer with rectangular grooves is designed for 106.4GHz electron cyclotron heating (ECH) system on the Heliotron-E helical device. The polarizer is installed on mirrors of waveguide miter bends. In oversized waveguides, the HE_{11} mode can be treated by the plane wave theory. The polarization of the reflected wave is calculated as a function of the groove parameters and the mirror rotation angle. When launching the ECH power to fusion devices with moderate or strong magnetic shear such as heliotron/torsatron configurations, we should take into account the change of the wave polarization through the plasma. The effect of the magnetic shear can be investigated by using the polarizer. The dependence of the absorbed power on the mirror rotation angle are presented. (author).

24873 (NIFS–335) **A self-consistent open boundary model for particle simulation in plasmas.** Takamaru, H.; Sato, T.; Horiuchi, R.; Watanabe, K. National Inst. for Fusion Science, Nagoya (Japan). Feb 1995. 20p. Order Number DE95789311. Source: OSTI; NTIS; INIS.

A particle simulation model with open boundary, applicable to a system in which the internal plasma contacts with an external plasma source such as a current generator, is developed. We present this formalism and examine the range of applicability of this procedure. This scheme assures a balance between the outgoing and incoming particle fluxes through the boundaries at each time step. The numerical code developed on this principle is applied to an ion acoustic double layer under the condition that the system is connected to a constant current generator to confirm the soundness and viability of the code. (author).

24874 (PPPL–3011-R) **Collisional stochastic ripple diffusion of alpha particles and beam ions on TFTR.** Redi, M.H.; Zarnstorff, M.C.; White, R.B.; Budny, R.V.; Janos, A.C.; Owens, D.K.; Schivell, J.F.; Scott, S.D.; Zweben, S.J. Princeton Univ., NJ (United States). Plasma Physics Lab. Jul 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95016245. Source: OSTI; NTIS; INIS; GPO Dep.

Predictions for ripple loss of fast ions from TFTR are investigated with a guiding center code including both collisional and ripple effects. A synergistic enhancement of fast ion diffusion is found for toroidal field ripple with collisions. The total loss is calculated to be roughly twice the sum of ripple and collisional losses calculated separately. Discrepancies between measurements and calculations of plasma beta at low current and large major radius are resolved when both effects are included for neutral beam ions. A 20–30% reduction in alpha particle heating is predicted for q_a = 6–14, R = 2.6 m DT plasmas on TFTR due to first orbit and collisional stochastic ripple diffusion.

24875 (PPPL–3114) **Alfven cyclotron instability and ion cyclotron emission.** Gorelenkov, N.N.; Cheng, C.Z. Princeton Univ., NJ (United States). Plasma Physics Lab. Jul 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95016239. Source: OSTI; NTIS; INIS; GPO Dep.

Two-dimensional solutions of compressional Alfven eigenmodes (CAE) are studied in the cold plasma approximation. For finite inverse aspect ratio tokamak plasmas the two-dimensional eigenmode envelope is localized at the low magnetic field side with the radial and poloidal localization on the order of $a/\sqrt{m}$ and a/(fourth root of m), respectively, where m is the dominant poloidal mode number. Charged fusion product driven Alfven Cyclotron Instability (ACI) of the compressional Alfven eigenmodes provides the explanation for the ion cyclotron emission (ICE) spectrum observed in tokamak experiments. The ACI is excited by fast charged fusion products via Doppler shifted cyclotron wave-particle resonances. The ion cyclotron and electron Landau dampings and fast particle instability drive are calculated perturbatively for deuterium-deuterium (DD) and deuterium-tritium (DT) plasmas. Near the plasma edge at the low field side the velocity distribution function of charged fusion products is localized in both pitch angle and velocity. The poloidal localization of the eigenmode enhances the ACI growth rates by a factor of $\sqrt{m}$ in comparison with the previous results without poloidal envelope. The thermal ion cyclotron damping determines that only modes with eigenfrequencies at multiples of the edge cyclotron frequency of the background ions can be easily excited and form an ICE spectrum similar to the experimental observations. Theoretical understanding is given for the results of TFTR DD and DT experiments with $v_{\alpha 0}/v_A < 1$ and JET experiments with $v_{\alpha 0}/v_A > 1$.

24876 (PPPL–3116) **Enhanced loss of fusion products during mode conversion heating in TFTR.** Darrow, D.S.; Majeski, R.; Fisch, N.J.; Heeter, R.F.; Herrmann, H.W.; Herrmann, M.C.; Zarnstorff, M.C.; Zweben, S.J. Princeton Univ., NJ (United States). Plasma Physics Lab. Jul 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95016240. Source: OSTI; NTIS; INIS; GPO Dep.

Ion Bernstein waves (IBWS) have been generated by mode conversion of ion cyclotron range of frequency (ICRF) fast waves in TFTR. The loss rate of fusion products in these discharges can be large, up to 10 times the first orbit loss rate. The losses are observed at the passing/trapped boundary, indicating that passing particles are being moved onto loss orbits either by increase of their $v_\perp$ due to the wave, by outward transport in minor radius, or both. The lost particles appear to be DD fusion produced tritons heated to ~1.5 times their birth energy.

24877 (PPPL–3120) **Experimental study of toroidicity-induced Alfven eigenmode (TAE) stability at high q(0).** Batha, S.H. (Fusion Physics and Technology, Torrance, CA (United States)); Levinton, F.M.; Spong, D.A. Princeton Univ., NJ (United States). Plasma Physics Lab. Jul 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95016241. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments to destabilize the Toroidicity-induced Alfven Eigenmode (TAE) by energetic alpha particles were performed on the Tokamak Fusion Test Reactor using deuterium and tritium fuel. To decrease the alpha particle pressure instability threshold, discharges with an elevated value of q(0) > 1.5 were used. By raising q(0), the radial location of the low toroidal-mode-number TAE gaps moves toward the magnetic axis and into alignment with the region of maximum alpha pressure gradient, thereby (in theory) lowering the value of $\beta_\alpha(0)$ required for instability. No TAE activity was observed when the central alpha particle β_α reached 0.08% in a discharge with fusion power of 2.4 MW. Calculations show that the fusion power is within a factor of 1.5 to 3 of the instability threshold.

24878 (PSC–39) **^{3}He-enrichments by magnetosonic waves in current-driven instabilities.** Zhang, T.X.; Ohsawa, Y. Nagoya Univ. (Japan). Plasma Science Center. Dec 1994. 41p. Order Number DE95789262. Source: OSTI; NTIS; INIS.

A theoretical model for ^{3}He-enrichments in solar energetic particles is developed. First, current-driven, electrostatic instabilities that have frequencies $\omega \simeq n\Omega_{^3He}$ ($\Omega_{^3He}$ is the cyclotron frequency of ^{3}He) are investigated for a plasma consisting of H, ^{4}He, ^{3}He, and electrons with the density of ^{3}He much lower than those of H and ^{4}He. It is found that in many cases the oblique ion acoustic waves can have positive growth rates at frequencies $\omega \simeq \Omega_{^3He}$ and, at the same time, negative growth rates at $\omega \simeq \Omega_{^4He}$ and at $\omega \simeq \Omega_H$. This can occur near the marginal state of the instability. The wave damping at these frequencies is caused by the cyclotron resonances of ^{4}He and H. The cyclotron damping at $\omega \simeq \Omega_{^3He}$ is negligible, however, because the abundance of ^{3}He is very small. The H cyclotron waves can be unstable at $\omega \simeq 2\Omega_{^3He}$ for a wide region of plasma parameters; the electron-to-ion temperature ratio must be $T_e/T_H >$ or approx. 1.5. To destabilize the ^{4}He cyclotron waves with $\omega \simeq \Omega_{^3He}$, high ^{4}He density and high electron temperature are both required. Then, ^{3}He-enrichments are studied on the basis of the theory of nonlinear magnetosonic waves, which can promptly accelerate ions. The current-driven electrostatic waves with $\omega \simeq n\Omega_{^3He}$ can enhance fluctuation velocities of ^{3}He. Thus, in the presence of these waves, magnetosonic waves can selectively accelerate ^{3}He particles to high energies. Finally, cyclotron resonances of heavy ions with the waves $\omega \simeq n\Omega_{^3He}$ or $\omega < \Omega_{^4He}$ are briefly discussed. (author).

24879 (UCRL-ID–119072) **Extrapolation of the Dutch 1 MW tunable free electron maser to a 5 MW ECRH source.** Caplan, M. (Lawrence Livermore National Lab., CA (United States)); Nelson, S.; Kamin, G.; Antonsen, T. Levush, B.; Urbanus, W.; Tulupov, A. Lawrence Livermore National Lab., CA (United States). 1 Apr 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014381. Source: OSTI; NTIS; INIS; GPO Dep.

A Free Electron Maser (FEM) is now under construction at the FOM Institute (Rijnhuizen) Netherlands with the goal of producing 1 MW long pulse to CW microwave output in the range 130 GHz to 250 GHz with wall plug efficiencies of 50% (Verhoeven, et al EC-9 Conference). An extrapolated version of this device is proposed which by scaling up the beam current, would produce microwave power levels of up to 5 MW CW in order to reduce the cost per watt and increase the power per module, thus providing the fusion community with a practical ECRH source.

(Lawrence Livermore National Lab., CA (United States)); Pearlstein, L.D.; Kritz, A.H. Lawrence Livermore National Lab., CA (United States); Lehigh Univ., Bethlehem, PA (United States). Jan 1995. 8p. Sponsored by USDOE, Washington, DC (United States);Atomic Energy of Canada Ltd., Ottawa, ON (Canada);Hydro-Quebec, Montreal, PQ (Canada);Schweizerischer Nationalfonds zur Foerderung der Wissenschaftlichen Forschung, Bern (Switzerland). DOE Contract W-7405-ENG-48 ; FG02-92ER54141. (CONF-950112–3: 9. joint workshop on electron cyclotron emission and electron cyclotron resonance heating, Borrego Springs, CA (United States), 23-26 Jan 1995). Order Number DE95013428. Source: OSTI; NTIS; INIS; GPO Dep.

Transmission measurements for waves near the fundamental and harmonics of the electron-cyclotron frequency indicate that propagation and absorption is not always correctly described when ray trajectories are obtained using cold-plasma analysis. Improved methods have been developed for evaluating the Shkarofsky functions, which appear in the weakly relativistic approximation of the dielectric tensor, for small parallel index of refraction. Computational results for vertical third-harmonic X-mode propagation in Tore Supra show strong, warm-plasma refraction effects that qualitatively agree with experimental observations.

24882 (CIEMAT–755) **Exporting Variables in a Hierarchically Distributed Control System.** Diaz Martin; Martinez Laso, L. No corporate text available. 1995. 20p. Order Number DE95780844. Source: OSTI; NTIS; INIS.

We describe the Remote Variable Access Service (RVAS), a network service developed and use in the distributed control and monitoring system of the TJ-II Heliac, which is under construction at CIEMAT (Madrid, Spain) and devoted to plasma studies in the nuclear fusion field. The architecture of the TJ-II control system consists of one central Sun workstation Sparc 10 and several autonomous subsystems based on VME crates with embedded processors running the os-9 (V.24) real time operating system. The RVAS service allows state variables in local control processes running in subsystems to be exported to remote processes running in the central control workstation. Thus we extend the concept of exporting of file systems in UNIX machines to variables in processes running in different machines. (Author)

24883 (CONF-941182–4) **Prospects and status of low-aspect-ratio tokamaks.** Peng, Y.K.M. Oak Ridge National Lab., TN (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. international Toki conference on plasma physics and controlled nuclear fusion: Research for advanced concepts in magnetic fusion; Toki-city (Japan); 29 Nov - 2 dec 1994. Order Number DE95013044. Source: OSTI; NTIS; INIS; GPO Dep.

The prospects for the low-aspect-ratio (A) tokamak to fulfill the requirements of viable fusion power plants are considered relative to the present status in data and modeling. Desirable physics and design features for an attractive Blanket Test Facility and power reactors are estimated for low-A tokamaks based on calculations improved with the latest data from small pioneering experiments.

While these experiments have confirmed some of the recent predictions for low-A, they also identify the remaining issues that require verification before reliable projections can be made for these deuterium-tritium applications. The results show that the low-A regime of small size, modest field, and high current offers a path complementary to the standard and high A tokamaks in developing the full potential of fusion power.

24884 (CONF-950892–8) **Energy-filtered plasmon images of $MgAl_2O_4$ implanted with Al^+ and Mg^+ ions.** Evans, N.D. (Oak Ridge Inst. for Science and Education, Oak Ridge, TN (United States)); Bentley, J.; Zinkle, S.J. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 53. annual meeting of Microscopy Society of America; Kansas City, KS (United States); 13-17 Aug 1995. Order Number DE95013036. Source: OSTI; NTIS; INIS; GPO Dep.

Magnesium aluminate spinel ($MgAl_2O_4$) is a candidate material for specialized applications in proposed fusion reactors, and previously, has been irradiated with Al^+ or Mg^+ ions to assess the effects of high-dose irradiation. Electron energy-loss spectrometry (EELS) has been used to confirm the identity of metallic aluminum colloids located in the ion-implanted region of the spinel because electron diffraction experiments were inconclusive for phase identification. In the present study, energy-filtered plasmon images of the ion-implanted region have been obtained to reveal this colloid distribution.

24885 (CONF-951001–1) **Prospects for Tokamak Fusion Reactors.** Sheffield, J.; Galambos, J. Oak Ridge National Lab., TN (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 16. World Energy Council congress; Makuhari (Japan); 8-13 Oct 1995. Order Number DE95009078. Source: OSTI; NTIS; INIS; GPO Dep.

This paper first reviews briefly the status and plans for research in magnetic fusion energy and discusses the prospects for the tokamak magnetic configuration to be the basis for a fusion power plant. Good progress has been made in achieving fusion reactor-level, deuterium-tritium (D-T) plasmas with the production of significant fusion power in the Joint European Torus (up to 2 MW) and the Tokamak Fusion Test Reactor (up to 10 MW) tokamaks. Advances on the technologies of heating, fueling, diagnostics, and materials supported these achievements. The successes have led to the initiation of the design phases of two tokamaks, the International Thermonuclear Experimental Reactor (ITER) and the US Toroidal Physics Experiment (TPX). ITER will demonstrate the controlled ignition and extended burn of D-T plasmas with steady state as an ultimate goal. ITER will further demonstrate technologies essential to a power plant in an integrated system and perform integrated testing of the high heat flux and nuclear components required to use fusion energy for practical purposes. TPX will complement ITER by testing advanced modes of steady-state plasma operation that, coupled with the developments in ITER, will lead to an optimized demonstration power plant.

Progress during this reporting period has spanned several areas ranging from studies of fundamental intense-beam transport physics, including comparisons of simulations with experimental results, to accelerator system design and simulation code development. Performance of the research described here has continued to benefit from the close collaboration with personnel at LBL and LLNL. In addition, studies of the longitudinal and transverse physics, which are jointly supported by the Division of High Energy Physics of the US Department of Energy, have benefitted from collaboration with personnel at the University of Maryland associated with the Maryland transport experiment. The research results supported by this program have been, and will be, actively reported to the scientific community through papers presented at conferences and published in conference proceedings as well as in the refereed literature. The work which has been documented for publication is described, in detail, in copies of the referenced material provided in the Appendix. This work is also summarized briefly in the next section. An additional section describing, in depth, research which has not yet been prepared for publication, is also included. This work investigates the basic nonlinear physics which is important to the design of large aperture magnetic quadrupole transport systems, as well as the numerical requirements for reliable simulation of that physics.

24887 (DOE-STD–0028-95) **Safety of magnetic fusion facilities: Volume 2, Guidance.** USDOE, Washington, DC (United States). [1995]. 194p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/M–4464). Order Number DE95014645. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides guidance for the implementation of the requirements identified in Vol. 1 of this Standard. This guidance is intended for the managers, designers, operators, and other personnel with safety responsibilities for facilities designated as magnetic fusion facilities. While Vol. 1 is generally applicable in that requirements there apply to a wide range of fusion facilities, this volume is concerned mainly with large facilities such as the International Thermonuclear Experimental Reactor (ITER). Using a risk-based prioritization, the concepts presented here may also be applied to other magnetic fusion facilities. This volume is oriented toward regulation in the Department of Energy (DOE) environment.

The report covers progress of the ASDEX Upgrade divertor tokamak and of the WENDELSTEIN 7-AS and WENDELSTEIN 7-X project. (orig.)

24890 (JAERI-Research–95-017) **Bulk shielding experiment on a large SS316/water assembly bombarded by D-T neutrons. V. 1. Experiment.** Konno, Chikara (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Maekawa, Fujio; Oyama, Yukio; Ikeda, Yujiro; Uno, Yoshitomo; Verzilov, Y.; Wada, Masayuki; Maekawa, Hiroshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 82p. Order Number DE95789316. Source: OSTI; NTIS; INIS.

It is under consideration in the ITER/EDA that water will be flowed through stainless steel in the shielding blanket and vacuum vessel as coolant. A bulk shielding experiment on a large SS316/water assembly was performed by using the FNS D-T neutron source in Japan Atomic Energy Research Institute as the '94 ITER/EDA task(T-16). The objectives of this experiment are to obtain experimental data for the shielding performance of SS316/water shield, to verify the shielding design system of ITER and to deduce the shielding design margin finally. The experimental system, measuring procedures and the measured data are described in this report and the analysis of the experiment is given separately in the Volume II. The test region of the experimental assembly is a layered structure of SS316 and water(volume ratio is 4:1), which had a cylindrical shape of 1200 mm in diameter and 1372 mm in thickness. This test region was set at 300 mm from the D-T neutron source which was surrounded by a source reflector made of 200 mm-thick SS316. The data for (i) neutron spectra in energy regions of MeV, keV and eV, (ii) neutron activation reaction rates, (iii) fission rates, (iv) gamma-ray spectra and (v) gamma-ray heating rates were measured from the front surface to the depth of 914 mm in the test region. The experimental data which included few

room-returned background were obtained even at the depth of 914 mm by adding water tanks or polyethylene blocks of about 160 mm in thickness around the rear part of the test region. The effect of water in SS316 on the shielding performance was examined from the comparison with the measured data of the previous SS316 bulk shielding experiments. It was found that SS316/water shield has shielding performance better by about 2 orders of magnitude than pure SS316 for neutrons less than 1 MeV and gamma-rays at the depth of 914 mm. (author).

24891 (JAERI-Research–95-018) **Bulk shielding experiment on a large SS316/water assembly bombarded by D-T neutrons. V. 2. Analysis.** Maekawa, Fujio (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Konno, Chikara; Wada, Masayuki; Oyama, Yukio; Ikeda, Yujiro; Uno, Yoshitomo; Verzilov, Y.; Maekawa, Hiroshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 126p. Order Number DE95789304. Source: OSTI; NTIS; INIS.

As a part of the Engineering Design Activities (EDA) of the International Thermonuclear Experimental Reactor (ITER), the bulk shielding experiment on a large SS316/water assembly bombarded by D-T neutrons were carried out at the FNS facility in JAERI. The experimental details are described in the separate issue, Volume I. In this report, Volume II, methods and results of the experimental analysis, and comparisons of the calculated results with the experiments are compiled. Two transport calculation codes, MCNP-4 and DOT-3.5, and cross section libraries based on JENDL-3.1 and JENDL-3.2 were used in the analysis. As a result, the following facts were found for shielding properties of the SS316/water shield to both neutrons and gamma-rays; (i) Neutron fluxes from 14 MeV down to thermal energy and gamma-ray heating rates can be predicted with high accuracy within 20% by the MCNP calculation with JENDL-3.2 and the DOT calculation with consideration of the self-shielding correction and 125-neutron and 40-gamma-ray energy groups. (ii) Although influences of the self-shielding correction and the number of energy groups are not so large as in the case of SS316 assemblies, further uncertainty of about 20% should be taken into the calculated results when the correction is omitted or 42-neutron and 21-gamma-ray energy groups are used. (iii) If thermal neutron fluxes are expressed in one energy group in multi-group calculations, a large error may be involved in the calculated results of thermal neutron flux in some cases. (author).

24892 (JAERI-Research–95-023) **Development of dual CO_2 laser interferometer for large tokamak.** Kawano, Yasunori (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Nagashima, Akira; Hatae, Takaki; Gunji, Soichi. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 33p. Order Number DE95789320. Source: OSTI; NTIS; INIS.

A new CO_2 laser interferometer has been developed to measure electron density of tokamak plasmas. Two different wavelength oscillators of 10.6 μm and 9.27 μm are utilized for simultaneous measurement of the density component and the optical path length change. A new technique of the common use of a frequency shifter for two color lasers improves the stability of the system by a complete matching of both beat frequencies. The system has advantages on practical problems of window darkening, large mechanical vibrations of reflection mirrors, monitoring of laser beams and simplified the optical layout design by using the close wavelength. The electron density of JT-60U plasma is successfully measured up to a plasma current of 3 MA. The density behavior of fast major disruptions are also diagnosed without a fringe loss. The effective density resolution is observed as 2×10^{19} m^{-2}, which corresponds to about a 1/10 fringe. An ultra high resolution ($1/10^4$ fringe) phase comparator has been developed to improve the density resolution of the dual CO_2 system. Achieved performance shows the feasibility of the dual CO_2 laser interferometer for future large devices such as ITER. (author).

24893 (JAERI-Tech–95-006) **Neutron spectral tailoring calculation in the JMTR. Feasible study on irradiation test simulating the fusion reactor condition.** Nagao, Yoshiharu (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Shimakawa, Satoshi; Komori, Yoshihiro; Sakurai, Fumio. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1995. 52p. (In Japanese). Order Number DE95789283. Source: OSTI; NTIS; INIS.

By adjusting the thermal-to-fast neutron flux ratio, it is feasible to carry out irradiation tests to simulate fast reactor or fusion reactor conditions and examine neutron spectrum effect in basic study of materials in testing reactor with mixed neutron spectrum such as the JMTR. For fusion reactor materials irradiation, the He-to-dpa ratio has been tailored to a fusion reactor condition (15 appm He/dpa). Thermal neutron irradiation of nickel-bearing materials generate high levels of helium due to $^{58}Ni(n,\gamma)^{59}Ni(n,\alpha)^{56}Fe$ reaction. This process is used to simulate fusion reactor He-to-dpa ratio in stainless steel-316. This paper describes the analytical result on the possible range of He-to-dpa ratio to simulate fusion reactor condition for stainless steel-316 irradiation in the JMTR. NIHE program was developed to evaluate helium production due to the ^{58}Ni two step reaction. It was found that He-to-dpa ratio in stainless steel-316 irradiation is able to be tailored within 13-15 appm He/dpa in the JMTR. (author).

24894 (JAERI-Tech–95-008) **Tokamak assembly and tooling.** Nakahira, Masataka (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Tada, Eisuke; Kanamori, Naokazu; Kakudate, Satoshi; Oka, Kiyoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1995. 78p. Order Number DE95789284. Source: OSTI; NTIS; INIS.

In fusion experimental reactors such as ITER, the reactor core will be highly activated due to D-T operation and the components inside the cryostat will have to be assembled and replaced by remote operation. Many of assembly procedures will have to be applied to remote replacement at a later time. Thus, fusion reactors should have replacable features which accommodate machine layout and structural configuration fully compatible with remote operation. From this point of view, this paper summarizes investigations about present outline design of ITER and the recommended overall design approach, philosophy and procedures for the assembly and replacement. (author).

24895 (JAERI-Tech–95-011) **Compatibility test of blanket structural materials with beryllium sphere in helium gas environment.** Kurasawa, Toshimasa (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Takatsu, Hideyuki; Seki, Masahiro; Ono, Kiyoshi; Kobayashi, Shigetada. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 31p. Order Number DE95789314. Source: OSTI; NTIS; INIS.

Compatibility of blanket structural materials with beryllium spheres under the helium environment was studied at temperatures of 650-750degC for periods of 700 and 1500hr. The examined materials were 316 stainless steel as a reference material and advanced structural materials such as titanium alloy (Ti-6Al-4V), reduced activity ferritic steel (F82H) and vanadium, all of which are candidate materials in the ITER blanket design. Reactions of Ti-6Al-4V alloy and F82H with Be sphere in helium gas containing impurities were occurred at the test of 750degC, 700hrs and 700degC, 1500hrs. It was not observed at the test of 700degC, 700hrs. This indicated that these blanket structural materials are less compatible with Be and helium containing impurities under the condition of high temperature over 700degC. In the case of vanadium, oxidation was observed at 750degC, 1500hrs in the helium environment. Clear grain boundary grooving was formed on the vanadium surface contacted with He. No obvious surface reaction layer was formed in the helium exposure test of 700degC, 1500hrs. This preliminary result shows that upper temperature limit of these advanced materials is around 700degC, though compatibility capabilities are nominally greater than that of 316 stainless steel as the reference material. (author).

24896 (JAERI-Tech–95-018) **Design study on a 1MeV, 12.5MW neutral beam injector module for ITER.** Okumura, Yoshikazu (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Hanada, Masaya; Inoue, Takashi; Miyamoto, Kenji; Ohara, Yoshihiro; Watanabe, Kazuhiro; Zimin, S.; Maki, Koichi; Maeno, Shuichi. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 112p. Order Number DE95789345. Source: OSTI; NTIS; INIS.

A high energy neutral beam injector has been designed for the International Thermo-nuclear Experimental Reactor(ITER). Two

types of designs are proposed; a short beamline option and a long beamline option. The short beamline option is characterized by a very short neutralizer, which makes it possible to integrate all the beamline components within the cryostat of ITER. The long beamline option has a conventional layout, where the beamline is installed outside the cryostat. In both cases, the system is more compact and more reactor-relevant than the ITER-CDA(Conceptual Design Activity) design, since the present design is based on the recent progress on the negative ion beam development. In the design, 25A D-ion beam is produced by a cesium-seeded volume negative ion source and accelerated to 1MeV by a multi-stage electrostatic accelerator. The beam is neutralized in a gas cell and 12.5MW (1MeV, 12.5A) neutral beam is injected into each injection port. Using 4 NBI modules and 4 ports, 50MW is to be injected into the plasma in ITER. A special emphasis is laid on the radiation shielding and the radiation effects in the beamline components, which was considered to be a serious problem in applying a neutral beam system for ITER. We found that the irradiation dose rate in the beamline components including the ion source/accelerator can be suppressed to a moderate value and no serious damage on these components is expected. (author).

24897 (JAERI-Tech--95-021) **Test program development for ITER blanket design.** Kurasawa, Toshimasa (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Sato, Satoshi; Furuya, Kazuyuki; Nakahira, Masataka; Togami, Ikuhide; Hashimoto, Toshiyuki; Takatsu, Hideyuki; Kuroda, Toshimasa. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 30p. Order Number DE95789313. Source: OSTI; NTIS; INIS.

Test programs for water-cooled and helium-cooled blankets have been developed. Following the description of ITER Experimental and DEMO reactors and blankets proposed for it, which are recently developed in Japan, test items and their features are indicated, Tests required for the development of ITER and DEMO blankets consist of neutronics test, scoping test, performance and performance verification tests, reliability enhancement test, and segment demonstration test. Procedure for these tests has been evolved on the assumption that neutron fluences onto test ports during the BPP and the EPP are 0.1 MWa/m^2 and 1-3 MWa/m^2, respectively. Comprehensive tests of the ITER driver blanket during the BPP are also proposed, which consist of neutronics and performance verification tests. (author).

24898 (JAERI-Tech--95-022) **Heat transfer experiments on the cooling tubes for divertor plates under one-sided heating conditions.** Araki, Masanori (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Ogawa, Masuro; Kunugi, Tomoaki. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 97p. Order Number DE95789325. Source: OSTI; NTIS; INIS.

No literatures and experimental results have been published so far prediction of heat transfer coefficients under one-sided heating conditions. It is a recent concern whether or not existing correlations developed for uniform heating conditions, i. e., Thom and/of Shah (Jens-Lottes) correlations, are applicable to one-sided heating conditions. Furthermore, they predict different values as large as twice even if the identical calculation condition is applied. This reason is attributable mainly to lack of database and wide extrapolation at high superheat region. In the cooling channel of the divertor plates, partial nucleate boiling will be expected due to high heat flux, resulting in the difficulty on the design such as the evaluation of the surface temperature of plasma facing components. Therefore, JAERI has carried out heat transfer experiments on two different test samples to systematically evaluate heat transfer phenomena under one-sided heating conditions. In the experiments, temperature profile along the circumference of the test sample were measured at a condition for the inlet water temperature from 20 to 80degC, the local water pressure from 0.5 to 1.5 Mpa, the flow velocity from 4 to 16m/s, and the peak surface heat flux ranged from 2 MW/m^2 to burnout. Simple comparisons between the experimental data and the existing heat transfer correlations were also done to investigate the applicability of use of the existing correlation to one-sided heating conditions. As a result of the comparison, the existing correlations are applicable to one-sided heating conditions at non-boiling region, but can not predict to the experimental results at partial nucleate boiling region with high superheat. As a first step to determine heat transfer correlations, an inverse analysis code of heat conduction problems was developed. (author).

24899 (JAERI-Tech--95-028) **Radiological safety of DT experiments at TFTR.** Miya, Naoyuki (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 50p. (In Japanese). Order Number DE95789343. Source: OSTI; NTIS; INIS.

Radiological safety problems of TFTR D-T experiments are described. Some topical issues of safety, such as current regulations, radiation shielding, radioactivation and tritium processing on TFTR are reported. During D-T experiments around 1x10^{20} D-T neutrons were produced and 20g of tritium have been processed for the first ten months. Prior to the experiment interior walls inside Test Cell were clad with supplementary shielding panels. Contribution of radioactivity to annual property line total dose equivalent is less than 2.4 mrem for an estimated maximum D-T neutron yield of 1x10^{21}/y. This result is consistent with the design objective of limiting the total dose at the property line, 10 mrem/y. Activation dose rate near vacuum vessel reaches 100 mrem/h during operations. Because of the TFTR site limit of 5g inventory on-site, TFTR operations are currently scheduled to have an on-site delivery of tritium every two weeks and corresponding off-site shipment of tritiated water. TFTR installed and commissioned a Tritium Purification System(TPS) which will provide on-site tritium purification and recycle capability. After the completion of two years D-T experiments, decontamination and decommissioning activities will commence for three years. (author).

24900 (JINR-D--13-92-581, pp. 223-227) **The use of programmable controllers in the control and monitoring system of a large nuclear fusion experiment.** Hemming, O.N.; Luchetta, A.; Schmidt, V.; Vitturi, S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (CONF-9209499--: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

Industrial programmable controllers are widely used not only in the field of production automation but in the course of performing large-scale physical experiments, for example, in nuclear fusion reaction studies or in the area of high-energy physics, which require constant observance and control. Their broad expansion was promoted by the following peculiarities: relatively low costs, built-in communication system, built-in man-computer interface and introduction of simple software. The application of programmable controllers is oriented mainly at relatively slow processes (not less than tens of milliseconds), highly-dependent on the number of inlets/outlets and on the applied software as well. The paper contains the authors report on achievements in the area of programmable controllers development, design and realization. The operation of modern systems for management and control over large-scale thermonuclear fusion synthesis is considered. 9 refs.; 3 figs.; 1 tab.

24901 (JINR-D--13-92-581, pp. 228-235) **The graphical user interface of the CAMAC based data acquisition system of the RFX nuclear fusion experiment.** Flor, G.; Fredian, T.W.; Fregonese, G.; Manduchi, G.; Stillerman, J.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (CONF-9209499--: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The graphical interface of the CAMAC data acquisition system intended for the RFX nuclear fusion experiment is described. The data acquisition system is developed on the basis of the VAX computers and the MDS-Plus software package which is based on the concept of an experiment model. The structure and possibilities of the MDS-Plus package is considered in details. It provides graphical interfaces both for experiment model editing and interactive display. 7 refs.; 4 figs.

24902 (LA-UR–95-1439) **The design and characterization of toroidal-shaped Nova hohlraums that simulate National Ignition Facility plasma conditions for plasma instability experiments.** Wilde, B.H. (Los Alamos National Lab., NM (United States)); Fernandez, J.C.; Hsing, W.W.; Cobble, J.A.; Delamater, N.D.; Krauser, W.J.; Lindman, E.L.; Failor, B.H. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950476–5: 12. international conference on laser interaction and related plasma phenomena, Osaka (Japan), 24-28 Apr 1995). Order Number DE95014010. Source: OSTI; NTIS; INIS; GPO Dep.

Special Nova hohlraums have been designed to simulate the plasma conditions calculated for various NIF hohlraum point designs. These hohlraums attempt to maximize the laser pathlength for parametric instability measurements. A toroidal-shaped hohlraum with a diameter of 3200 microns and a length of 1600 microns allows a laser pathlength of about 2 mm. Filling the hohlraum with 1 atmosphere of neopentane gas gives an electron temperature of 3 keV and electron density near 0.1 of critical. Detailed LASNEX calculations for these hohlraums and comparisons to the NIF point design will be presented. Comparisons between data and calculations that characterize the plasma conditions (electron, radiation, and ion temperatures, electron density, etc) in these Nova hohlraums will also be shown.

24903 (LBL–36487) **A high charge state heavy ion beam source for HIF.** Eylon, S. (Duly Research, Inc., Rancho Palos Verdes, CA (United States)); Henestroza, E. Lawrence Berkeley Lab., CA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ; FG03-94ER81741. (CONF-950512–282: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014782. Source: OSTI; NTIS; INIS; GPO Dep.

A high current low emittance high charge state heavy ion beam source is being developed. This is designed to deliver HIF (heavy ion fusion) driver accelerator scale beam. Using high-charge-state beam in a driver accelerator for HIF may increase the acceleration efficiency, leading to a reduction in the driver accelerator size and cost. The proposed source system which consists of the gas beam electron stripper followed by a high charge state beam separator, can be added to existing single charge state, low emittance, high brightness ion sources and injectors. We shall report on the source physics design using 2D beam envelope simulations and experimental feasibility studies' results using a neutral gas stripper and a beam separator at the exit of the LBL 2 MV injector.

24904 (LBL-PUB–754, pp. 257-262) **The "first" problem.** Holsinger, R.F. Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the first magnet design problem that Klaus and the author worked on together. At the time, over 30 years ago, Klaus was working as a plasma physicist in the Controlled Thermonuclear Research (CTR) Group, and the author was assigned from the Mechanical Engineering Department to help with the design of experimental equipment for various research projects. Klaus' primary research program was to develop a "plasma gun" for injecting plasma into "mirror machines." As described, the magnet design aspect of this plasma gun was a challenging task, and led to some innovations that were quite advanced at that time.

24905 Direct current sputtering of boron from boron/carbon mixtures. Timberlake, J.R.; Manos, D.; Nartowitz, E. 1993. Filed date 27 May 1993. U.S. Patent Application 8-067,967. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95015040. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A method for coating a substrate with boron by sputtering includes lowering the electrical resistance of a boron-containing rod to allow electrical conduction in the rod; placing the boron-containing rod inside a vacuum chamber containing substrate material to be coated; applying an electrical potential between the boron target material and the vacuum chamber; countering a current avalanche that commences when the conduction heating rate exceeds the cooling rate, and until a steady equilibrium heating current is reached and coating the substrate material with boron by sputtering from the boron-containing rod.

24906 (SAND–93-3918C) **High quality actively cooled plasma facing components for fusion.** Nygren, R. Sandia National Labs., Albuquerque, NM (United States). [1993]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-940664–36: ISFNT-3: 3rd international symposium on fusion nuclear technology, Los Angeles, CA (United States), 27 Jun - 1 jul 1994). Order Number DE95013025. Source: OSTI; NTIS; INIS; GPO Dep.

This paper interweaves some suggestions for developing actively-cooled PFCs (plasma facing components) for future fusion devices with supporting examples taken from the design, fabrication and operation of Tore Supra's Phase III Outboard Pump Limiter (OPL). This actively-cooled midplane limiter, designed for heat and particle removal during long pulse operation, has been operated in essentially thermally steady state conditions. From experience with testing to identify braze flaws in the OPL, recommendations are made to analyze the impact of joining flaws on thermal-hydraulic performance of PFCs and to validate a method of inspection for such flaws early in the design development. Capability for extensive in-service monitoring of future PFCs is also recommended and the extensive calorimetry and IR thermography used to confirm and update safe operating limits for power handling of the OPL are reviewed.

24907 (UCRL–52000-95-4) **Energy & technology review, April 1995.** Bookless, W.A.; Stull, S. (eds.). Lawrence Livermore National Lab., CA (United States). Apr 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015109. Source: OSTI; NTIS; INIS; GPO Dep.

This publication presents research overviews on projects from the Lawrence Livermore laboratory. This issue provides information on microsphere targets for inertial confinement fusion experiments; laser fabrication of berllium components; and the kinetic energy interceptor.

24908 (UCRL-CR–120302-Pt.2) **Final report task order number B239641 between the Regents of the University of California and Institute of Experimental Physics task 2: Switch development.** Galakhov, I.V. (Russian Federal Nuclear Center (Russian Federation)); Gruzin, I.A.; Gudov, S.N.; Kirillov, G.A.; Logutenko, S.L.; Murugov, V.M.; Osin, V.A.; Zolotovskii, V.I. Lawrence Livermore National Lab., CA (United States); Russian Federal Nuclear Center (Russian Federation). 1994. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013269. Source: OSTI; NTIS; INIS; GPO Dep.

The LLNL project of the pulsed power system for the National Ignition Facility requires a switch with the following operational parameters: peak current of 400 kA, the transferred charge of 150 C, operating voltage of 25 kV, and reliable operating life of 10,000 shots. A review of high-power switches is given with detailed studies on vacuum switches and semiconductor switches.

24909 (UCRL-ID–118528) **NIF target fill, transport and insertion cryostat.** Warren, R. Lawrence Livermore National Lab., CA (United States). 20 Sep 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011765. Source: OSTI; NTIS; INIS; GPO Dep.

A cryostat to support the fielding of a cryogenic target within the NIF is described. The present design is predicated upon fuel layer symmetry being achieved with the β layering process and modifications needed for other fuel symmetrization processes are discussed. These include the vertically differentially heated capsule with a uniform liquid layer stabilized by a surface tension gradient, foam supported liquid layers and solid D_2 or HD layers symmetrized by bulk irradiation from a laser source. The cold sinks to be incorporated in these techniques could, in principal, be cooled with the high pressure helium envisioned for the heat sink rings of the present design. Supplementary laser access would be provided for differential heating of the capsule for surface tension gradient stabilization of a liquid layer or bulk heating of a solid layer. The cryostat in each of these cases would look substantially the same

as in the present case with the only significant differences being in the details of the design in the immediate vicinity of the target.

24910 (UCRL-ID–119107) **Temperature measurements of shock-compressed deuterium.** Holmes, N.C.; Ross, M.; Nellis, W.J. Lawrence Livermore National Lab., CA (United States). Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015421. Source: OSTI; NTIS; INIS; GPO Dep.

The authors measured the temperatures of single and double-shocked D_2 and H_2 up to 85 GPa (0.85 Mbar) and 5,200 K. While single shock temperatures, at pressures to 23 GPa, agree well with previous models, the double shock temperatures are as much as 40% lower than predicted. This is believed to be caused by molecular dissociation, and a new model of the hydrogen EOS at extreme conditions has been developed which correctly predicts their observations. These data and model have important implications for programs which use condensed-phase hydrogen in implosion systems.

24911 (UCRL-ID–119932) **Large-aperture, high-damage-threshold optics for beamlet.** Campbell, J.H.; Atherton, L.J.; DeYoreo, J.J.; Kozlowski, M.R.; Maney, R.T.; Montesanti, R.C.; Sheehan, L.M.; Barker, C.E. Lawrence Livermore National Lab., CA (United States). 23 Feb 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015383. Source: OSTI; NTIS; INIS; GPO Dep.

Beamlet serves as a test bed for the proposed NIF laser design and components. Therefore, its optics are similar in size and quality to those proposed for the NIF. In general, the optics in the main laser cavity and transport section of Beamlet are larger and have higher damage thresholds than the optics manufactured for any of our previous laser systems. In addition, the quality of the Beamlet optical materials is higher, leading to better wavefront quality, higher optical transmission, and lower-intensity modulation of the output laser beam than, for example, that typically achieved on Nova. In this article, we discuss the properties and characteristics of the large-aperture optics used on Beamlet.

24912 (UCRL-ID–120913) **Decomposable Mandrel Project. Progress report.** Letts, S.A.; Fearon, E.; Allison, L.; Buckley, S.; Saculla, M.; Cook, R. Lawrence Livermore National Lab., CA (United States). 8 May 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014515. Source: OSTI; NTIS; INIS; GPO Dep.

We report on our progress in developing a new technology to produce both Nova and NIF scale capsules using a depolymerizable mandrel. In this technique we use poly(α-methylstyrene) (PAMS) beads or shells as mandrels which are overcoated with plasma polymer. The poly(α-methylstyrene) mandrel is then thermally depolymerized to gas phase monomer which diffuses away through the more thermally stable plasma polymer coating, leaving a hollow shell. Since our last report we have concentrated on characterization of the final shell. Starting with PAMS bead mandrels leads to distorted pyrolyzed shells because of thermally induced creep of the CH coating. We found that plasma polymer coatings on hollow shell mandrels shrink isotropically during pyrolysis and maintain sphericity. We are now concentrating our efforts on the use of microencapsulated shells to prepare targets with buried diagnostic layers or inner wall surface texture.

24913 (UCRL-ID–121339) **Derivation of preliminary specifications for transmitted wavefront and surface roughness for large optics used in inertial confinement fusion.** Aikens, D. (Lawrence Livermore National Lab., CA (United States)); Roussel, A.; Bray, M. Lawrence Livermore National Lab., CA (United States). 27 Jun 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015975. Source: OSTI; NTIS; INIS; GPO Dep.

In preparation for beginning the design of the Nation Ignition Facility (NIF) in the United States and the Laser Mega-Joule (LMJ) in France, the authors are in the process of deriving new specifications for the large optics required for these facilities. Traditionally, specifications for transmitted wavefront and surface roughness of large ICF optics have been based on parameters which were easily measured during the early 1980's, such as peak-to-valley wavefront error (PV) and root-mean-square (RMS) surface roughness, as well as wavefront gradients in terms of waves per cm. While this was convenient from a fabrication perspective, since the specifications could be easily interpreted by fabricators in terms which were understood and conventionally measurable, it did not accurately reflect the requirements of the laser system. For the NIF and LMJ laser systems, the authors use advances in metrology and interferometry and an enhanced understanding of laser system performance to derive specifications which are based on power spectral densities (PSD's.) Such requirements can more accurately reflect the requirements of the laser system for minimizing the amplitude of mid- and high-spatial frequency surface and transmitted wavefront errors, while not over constraining the fabrication in terms of low spatial frequencies, such as residual coma or astigmatism, which are typically of a very large amplitude compared to periodic errors. In order to study the effect of changes in individual component tolerances, it is most useful to have a model capable of simulating real behavior. The basis of this model is discussed in this paper, outlining the general approach to the "theoretical" study of ICF optics specifications, and an indication of the type of specification to be expected will be shown, based upon existing ICF laser optics.

24914 (UCRL-JC–117302) **Diode-pumped solid state laser for inertial fusion energy.** Payne, S.A. (and others); Krupke, W.F.; Orth, C.D. Lawrence Livermore National Lab., CA (United States). Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9411152–6: International Atomic Energy Agency (IAEA) technical committee meeting on drivers for inertial confinement fusion, Paris (France), 14-18 Nov 1994). Order Number DE95014166. Source: OSTI; NTIS; INIS; GPO Dep.

The authors evaluate the prospect for development of a diode-pumped solid-state-laser driver in an inertial fusion energy power plant. Using a computer code, they predict that their 1 GWe design will offer electricity at 8.6 cents/kW · hr with the laser operating at 8.6% efficiency and the recycled power level at 31%. The results of their initial subscale experimental testbed of a diode-pumped solid state laser are encouraging, demonstrating good efficiencies and robustness.

24915 (UCRL-JC–117332) **Progress in heavy-ion drivers for inertial fusion.** Friedman, A. (Lawrence Livermore National Lab., CA (United States)); Bangerter, R.O.; Herrmannsfeldt, W.B. Lawrence Livermore National Lab., CA (United States). 22 Dec 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9411152–5: International Atomic Energy Agency (IAEA) technical committee meeting on drivers for inertial confinement fusion, Paris (France), 14-18 Nov 1994). Order Number DE95014134. Source: OSTI; NTIS; INIS; GPO Dep.

Heavy-ion induction accelerators are being developed as fusion drivers for ICF power production in the US Inertial Fusion Energy (IFE) program, in the Office of Fusion Energy of the US Department of Energy. In addition, they represent an attractive driver option for a high-yield microfusion facility for defense research. This paper describes recent progress in induction drivers for Heavy-Ion Fusion (HIF), and plans for future work. It presents research aimed at developing drivers having reduced cost and size, specifically advanced induction linacs and recirculating induction accelerators (recirculators). The goals and design of the Elise accelerator being built at Lawrence Berkeley Laboratory (LBL), as the first stage of the ILSE (Induction Linac Systems Experiments) program, are described. Elise will accelerate, for the first time, space-charge-dominated ion beams which are of full driver scale in line-charge density and diameter. Elise will be a platform on which the critical beam manipulations of the induction approach can be explored. An experimental program at Lawrence Livermore National Laboratory (LLNL) exploring the recirculator principle on a small scale is described in some detail; it is expected that these studies will result ultimately in an operational prototype recirculating induction accelerator. In addition, other elements of the US HIF program are described.

24916 (UCRL-JC–117389) **Production of hollow microspheres for inertial confinement fusion experiments.** Cook, R.

Lawrence Livermore National Lab., CA (United States). Dec 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941144–165: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95015028. Source: OSTI; NTIS; INIS; GPO Dep.

The targets used in inertial confinement fusion (ICF) experiments at the Lawrence Livermore National Laboratory are plastic capsules roughly 0.5 mm in diameter. The capsules, which typically have wall thicknesses from 20 to 60 μm, must possess extraordinary symmetry and concentricity and must have surface finishes of less than 1000 Å peak-to-valley variation over surface contours of from 10 to 100's of μm. This paper reviews the fabrication of these capsules, focusing on the production of the thin-walled polystyrene microshell mandrel around which the capsule is built. The relationship between the capsule characteristics, especially surface finish, and capsule performance is discussed, as are the methods of surface characterization and modification necessary for experiments designed to study the effects of surface roughness on implosion dynamics. Targets for the next generation of ICF facilities using more powerful laser drivers will have to be larger while meeting the same or even more stringent symmetry and surface finish requirements. Some of the technologies for meeting these needs are discussed briefly.

24917 (UCRL-JC–117397-Rev.1) **The National Ignition Facility Project. Revision 1.** Paisner, J.A.; Campbell, E.M.; Hogan, W.J. Lawrence Livermore National Lab., CA (United States). 16 Jun 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940602–23-Rev.1: 35. annual meeting of the American Nuclear Society, New Orleans, LA (United States), 11-16 Jun 1994). Order Number DE95015032. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the National Ignition Facility is to achieve ignition and gain in inertial confinement fusion targets in the laboratory. The facility will be used for defense applications such as weapons physics and weapons effects testing, and for civilian applications such as fusion energy development and fundamental studies of matter at high temperatures and densities. This paper reviews the design, schedule, and costs associated with the construction project.

24918 (UCRL-JC–118104) **Gas-filled targets for large scale-length plasma interaction experiments on Nova.** Powers, L.V. (and others); Berger, R.L.; Munro, D.H. Lawrence Livermore National Lab., CA (United States). Nov 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941101–12: Meeting of the Division of Plasma Physics of the American Physical Society, Minneapolis, MN (United States), 7-11 Nov 1994). Order Number DE95014538. Source: OSTI; NTIS; INIS; GPO Dep.

Stimulated Brillouin backscatter from large scale length gas-filled targets has been measured on Nova. These targets were designed to approximate conditions in indirect drive ignition target designs in underdense plasma electron density ($n_e \sim 10^{21}/cm^3$), temperature ($T_e > 3$ keV), and gradient scale lengths ($L_n \sim$ mm, $L_v > 6$ mm) as well as calculated gain for stimulated Brillouin scattering (SBS). The targets used in these experiments were gas-filled balloons with polyimide walls (gasbags) and gas-filled hohlraums. Detailed characterization using x-ray imaging and x-ray and optical spectroscopy verifies that the calculated plasma conditions are achieved. Time-resolved SBS backscatter from these targets is <3% for conditions similar to ignition target designs.

24919 (UCRL-JC–118156-Pt.1) **Laser-induced damage in dielectrics with nanosecond to subpicosecond pulses. I. Experimental. Part 1.** Stuart, B.C.; Herman, S.; Perry, M.D. Lawrence Livermore National Lab., CA (United States). Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410155–5-Pt.1: 26. annual symposium on optical materials for high power lasers: Boulder damage symposium, Boulder, CO (United States), 24-26 Oct 1994). Order Number DE95014537. Source: OSTI; NTIS; INIS; GPO Dep.

The authors report extensive laser-induced damage threshold measurements on pure and multilayer dielectrics at 1053 and 526 mm for pulse durations, τ, ranging from 140 fs to 1 ns. Qualitative differences in the morphology of damage and a departure from the diffusion-dominated $\tau^{1/2}$ scaling indicate that damage results from plasma formation and ablation for $\tau \leq 10$ ps and from conventional melting and boiling for $\tau > 50$ ps. A theoretical model based on electron production via multiphoton ionization, Joule heating, and collisional (avalanche) ionization is in good agreement with both the pulsewidth and wavelength scaling of experimental results.

24920 (UCRL-JC–118156-Pt.2) **Laser-induced damage in dielectrics with nanosecond to subpicosecond pulses. II. Theory.** Feit, M.D. (and others); Rubenchik, A.M.; Shore, B.W. Lawrence Livermore National Lab., CA (United States). Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410155–6-Pt.2: 26. annual symposium on optical materials for high power lasers: Boulder damage symposium, Boulder, CO (United States), 24-26 Oct 1994). Order Number DE95014536. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have reported extensive measurements of damage thresholds for fused silica and several fluorides (LiF, CaF, MgF, and BaF) at 1053 and 526 nm for pulse durations, τ, ranging from 275 fs to 1 ns. A theoretical model based on electron production via multiphoton ionization, Joule heating, and collisional (avalanche) ionization is in good agreement with experimental results.

24921 (UCRL-JC–118517) **Review of hohlraum coupling.** Kauffman, R.L. Lawrence Livermore National Lab., CA (United States). 30 Jan 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409226–9: ECLIM 23: laser interaction with matter, Oxford (United Kingdom), 19-23 Sep 1994). Order Number DE95014368. Source: OSTI; NTIS; INIS; GPO Dep.

Extensive experiments have been done to characterize laser-heated hohlraum targets for indirect drive inertial fusion. Scattered light and fast electrons from laser-plasma instabilities have been found not to be significant for short wavelength light. Scaling of radiation temperature with laser power has been studied at several Laboratories and can be represented by a simple power balance scaling for experiments using short wavelength light. Measurements of x-ray production and energy loss in hohlraum walls have been made to study details of the power balance model.

24922 (UCRL-JC–118523) **National Ignition Facility design, performance, and cost.** Hogan, W.J. (and others); Paisner, J.A.; Lowdermilk, W.H. Lawrence Livermore National Lab., CA (United States). 16 Sep 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409226–8: ECLIM 23: laser interaction with matter, Oxford (United Kingdom), 19-23 Sep 1994). Order Number DE95011766. Source: OSTI; NTIS; GPO Dep.

A conceptual design for the National Ignition Facility (NIF) has been completed and its cost has been estimated by a multilaboratory team. To maximize the performance/cost ratio a compact, segmented amplifier is used in a multipass architecture. Many recent optical and laser technology developments have been incorporated into the final design. The Beamlet project has successfully demonstrated the new concept. The mission of ICF Program using the NEF is to achieve ignition and gain in the laboratory. The facility will be used for defense applications such as weapons physics and weapons effects experiments, and for civilian applications such as inertial fusion energy development and fundamental studies of matter at high energy density.

24923 (UCRL-JC–118837) **Diagnostics for the detection and evaluation of laser induced damage.** Sheehan, L.; Kozlowski, M.; Rainer, F. Lawrence Livermore National Lab., CA (United States). 3 Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410155–7: 26. annual symposium on optical materials for high power lasers: Boulder damage symposium, Boulder, CO (United States), 24-26 Oct 1994). Order Number DE95014517. Source: OSTI; NTIS; INIS; GPO Dep.

The Laser Damage and Conditioning Group at LLNL is evaluating diagnostics which will help make damage testing more efficient and reduce the risk of damage during laser conditioning. The work to date has focused on photoacoustic and scattered light measurements on 1064-nm wavelength HfO_2/SiO_2 multilayer mirror and

polarizer coatings. Both the acoustic and scatter diagnostics have resolved 10 μm diameter damage points in these coatings. Using a scanning stage, the scatter diagnostic can map both intrinsic and laser-induced scatter. Damage threshold measurements obtained using scatter diagnostics compare within experimental error with those measured using 100x Nomarski microscopy. Scatter signals measured during laser conditioning can be used to detect damage related to nodular defects.

99 GENERAL AND MISCELLANEOUS

24924 (CONF-9505221–1) **Adventures in Supercomputing: An innovative program.** Summers, B.G.; Hicks, H.R.; Oliver, C.E. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Dual-use technologies and applications conference; Utica, NY (United States); 22-25 May 1995. Order Number DE95013202. Source: OSTI; NTIS; GPO Dep.

Within the realm of education, seldom does an innovative program become available with the potential to change an educator's teaching methodology and serve as a spur to systemic reform. The Adventures in Supercomputing (AiS) program, sponsored by the Department of Energy, is such a program. Adventures in Supercomputing is a program for high school and middle school teachers. It has helped to change the teaching paradigm of many of the teachers involved in the program from a teacher-centered classroom to a student-centered classroom. "A student-centered classroom offers better opportunities for development of internal motivation, planning skills, goal setting and perseverance than does the traditional teacher-directed mode". Not only is the process of teaching changed, but evidences of systemic reform are beginning to surface. After describing the program, the authors discuss the teaching strategies being used and the evidences of systemic change in many of the AiS schools in Tennessee.

24925 (DOE/BP–2504) **Hydromania: Summer science camp curriculum.** USDOE Bonneville Power Administration, Portland, OR (United States). [1995]. 168p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014449. Source: OSTI; NTIS; GPO Dep.

In 1992, Bonneville Power Administration (BPA) and the US Department of Energy (DOE) began a collaborative pilot project with the Portland Parks and Recreation Community Schools Program and others to provide summer science camps to children in Grades 4–6. Camps run two weeks in duration between late June and mid-August. Sessions are five days per week, from 9 a.m. to 3 p.m. In addition to hands-on science and math curriculum, at least three field trips are incorporated into the educational learning experience. The purpose of the BPA/DOE summer camps is to make available opportunities for fun, motivating experiences in science to students who otherwise would have difficulty accessing them. This includes inner city, minority, rural and low income students. Public law 101-510, which Congress passed in 1990, authorizes DOE facilities to establish collaborative inner-city and rural partnership programs in science and math. A primary goal of the BPA summer hands on science camps is to bring affordable science camp experiences to students where they live. It uses everyday materials to engage students' minds and to give them a sense that they have succeeded through a fun hands-on learning environment.

24926 (DOE/ER/75665–2) **DOE/EPSCoR Traineeship Program: Progress report, academic year 1992–93. Annual report 1993.** Hodgson, D.; Steadman, J. Wyoming Univ., Laramie, WY (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER75665. Order Number DE95015506. Source: OSTI; NTIS; GPO Dep.

This progress report reviews the University of Wyoming's approach to implementing the DOE Traineeship Program, and briefly describes the research performed by the DOE/EPSCoR Trainees during the academic year, 1992–1993. These brief descriptions of individual research projects demonstrate the wide scope of energy-related research that the DOE-EPSCoR Traineeships have initiated in Wyoming. The availability of this funding has encouraged many talented students to continue their education in fields of interest to DOE. These additional bright, energetic graduate students have improved the educational atmosphere for everyone. The visibility of the DOE program has sharpened the focus of the science and engineering departments on the energy-related research of importance to Wyoming and DOE. The impact of the DOE Traineeships in Wyoming has been substantial and very positive. It has not only increased the number of students studying in energy-related disciplines, but has also increased the quality of their graduate research. The program has also increased the visibility of DOE in Wyoming and has helped focus attention on the energy and environmental graduate education which is so essential to the University and the State.

24927 (DOE/ER/75665–3) **DOE/EPSCoR Traineeship Program: Final report, 1994.** Gern, W.; Steadman, J. Wyoming Univ., Laramie, WY (United States). [1994]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER75665. Order Number DE95015588. Source: OSTI; NTIS; GPO Dep.

This report reviews the University of Wyoming's approach to implementing the DOE Traineeship Program, and briefly describes the research performed by the DOE/EPSCoR Trainees during Years 2 and 3 of the Traineeship Program, 1992–1994, as of August 1994. These brief descriptions of individual research projects demonstrate the wide scope of energy-related research that the DOE-EPSCoR Traineeships have initiated in Wyoming. The availability of this funding has encouraged many talented students to continue their education in fields of interest to DOE. These additional graduate students have improved the educational atmosphere for everyone. The visibility of the DOE program has sharpened the focus of the science and engineering departments on the energy-related research of importance to Wyoming and DOE. The impact of the DOE Traineeships in Wyoming has been substantial and very positive. It has not only increased the number of students studying in energy-related disciplines, but has also increased the quality of their graduate research. The program has also increased the visibility of DOE in Wyoming and has helped focus attention on the energy and environmental graduate education which is so essential to the University and the State.

24928 (DOE/SR/18048–4) **Student Science Enrichment Training Program.** Sandhu, S.S. Claflin Coll., Orangeburg, SC (United States). [1990]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-88SR18048. Order Number DE95014981. Source: OSTI; NTIS; GPO Dep.

Funds are requested for the science enrichment training program (emphasis on chemistry and computer science), which will be held at Claflin College during the 1990 and 1991 summers, concomitant with summer school. The thirty participants will include high school students and some college freshmen; the students will come from rural South Carolina schools with limited science and computer facilities. Focus will be on high ability minority students.

24929 (SAND–95-0348C) **Human factors in agile manufacturing.** Forsythe, C. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951092–1: Human Factors and Ergonomics Society meeting, San Diego, CA (United States), 9-13 Oct 1995). Order Number DE95007740. Source: OSTI; NTIS; GPO Dep.

As industries position themselves for the competitive markets of today, and the increasingly competitive global markets of the 21st century, agility, or the ability to rapidly develop and produce new products, represents a common trend. Agility manifests itself in many different forms, with the agile manufacturing paradigm proposed by the Iacocca Institute offering a generally accepted, long-term vision. In its many forms, common elements of agility or agile manufacturing include: changes in business, engineering and production practices, seamless information flow from design through production, integration of computer and information technologies into all facets of the product development and production process, application of communications technologies to enable collaborative work between geographically dispersed product development team members and introduction of flexible automation of production processes. Industry has rarely experienced as dramatic an infusion of new technologies or as extensive a change in culture and work practices. Human factors will not only play a vital

role in accomplishing the technical and social objectives of agile manufacturing. but has an opportunity to participate in shaping the evolution of industry paradigms for the 21st century.

24930 (BNL–52447) **Brookhaven highlights 1994.** Brookhaven National Lab., Upton, NY (United States). [1994]. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95013317. Source: OSTI; NTIS; INIS; GPO Dep.

Established in 1947 on Long Island, New York, on the site of the former army Camp Upton, BNL is a multidisciplinary laboratory that carries out basic and applied research in the physical, biomedical and environmental sciences and in selected energy technologies. The Laboratory is managed by Associated Universities, Inc., under contract to the US Department of Energy. BNL's annual budget is about $400 million, and the Laboratory's facilities are valued at replacements cost in excess of over $2.8 billion. Employees number around 3,300,and over 4,000 guests, collaborators and students come each year to use the Laboratory's facilities and work with the staff. Scientific and technical achievements at BNL have made their way into daily life in areas as varied as health care, construction materials and video games. The backbone of these developments is fundamental research, which is and always will be an investment in the future.

24931 (CONF-9410190–Absts.) **18th Annual TRADE Conference: Abstracts.** Oak Ridge Associated Universities, Inc., TN (United States). [1994]. 207p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00033. From 18. annual training resources and data exchange conference: meeting line management expectations; Dallas, TX (United States); 31 Oct - 2 nov 1994. Order Number DE95010551. Source: OSTI; NTIS; GPO Dep.

This document consists of abstracts, authors, and author's business addresses from the 1994 annual Training Resources and Data Exchange (TRADE) conference. A wide variety of training mechanisms and media are presented on an even wider variety of topics.

24932 (DOE/EM–0240) **Cost Quality Management Assessment for the Idaho Operations Office. Final report.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Engineering and Cost Management. Jun 1995. 151p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014140. Source: OSTI; NTIS; INIS; GPO Dep.

The Office of Engineering and Cost Management (EM-24) conducted a Cost Quality Management Assessment of EM-30 and EM-40 activities at the Idaho National Engineering Laboratory on Feb. 3–19, 1992 (Round I). The CQMA team assessed the cost and cost-related management activities at INEL. The Round II CQMA, conducted at INEL Sept. 19–29, 1994, reviewed EM-30, EM-40, EM-50, and EM-60 cost and cost-related management practices against performance objectives and criteria. Round II did not address indirect cost analysis. INEL has made measurable progress since Round I.

24933 (DOE/IG–0374) **Audit of the Department of Energy's Commercial Laboratory Quality Assurance Evaluation Program.** USDOE Office of Inspector General, Washington, DC (United States). Capital Regional Audit Office. Jun 1995. 17p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

The Department of Energy (Department), through its contractors, contracts with commercial analytical laboratories for the analysis of samples related to environmental management activities and worker health and safety programs. Over 100 commercial laboratories located throughout the United States perform sample analyses for the Department, Because of problems identified during previous audit work, we initiated our audit to determine whether the Department's commercial laboratory quality assurance evaluation program was effective and efficient.

24934 (DOE/NV/11432–181) **Qualitative validation of emergency response procedures.** Francis, A.A. Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). Jun 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-94NV11432. Order Number DE95014556. Source: OSTI; NTIS; GPO Dep.

Emergency managers have come to recognize that there is a quintessential style of emergency response procedure development that must be guarded against. This style allows the definition of objectives to be decided upon apart from the problems posed by their implementation, and then permits the brushing aside of such obstacles as mere tactical problems to be dealt with once goals have been clarified. If permitted to pervade emergency management policy-making, this "can do" spirit will grow steadily more confused and complex each step of the way. Instead of plowing bravely ahead in the confident belief that a formidable array of talent and resources will overcome any obstacle, intuitive managers periodically pause and take inventory of accumulated liabilities and difficulties associated with their emergency response procedures. This work suggests use of the extreme value analysis principle in conjunction with time/loss analysis as the inventory tool to gauge the effectiveness of procedures in the response phase, or amelioration process, of an incident.

24935 (DOE-TSL–1-95) **Department of Energy Standards Index.** USDOE Assistant Secretary for Nuclear Energy, Washington, DC (United States). Office of Nuclear Safety Policy and Standards. Aug 1995. 77p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015401. Source: OSTI; NTIS; GPO Dep.

This TSL, intended for use in selecting and using DOE technical standards and other Government and non-Government standards, provides listing of current and inactive DOE technical standards, non-Government standards adopted by DOE, other Government documents in which DOE has a recorded interest, and cancelled DOE technical standards.

24936 (DOE-TSL–4-95) **Directory of DOE and contractor personnel involved in non-government standards activities.** USDOE, Washington, DC (United States). Aug 1995. 157p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015703. Source: OSTI; NTIS; GPO Dep.

This document contains a listing of DOE employees and DOE contractors who have submitted form DOE F 1300.2, Record of Non-Government Standards Activity. Additional names were added from rosters supplied by non-Government standards bodies.

24937 (JAERI-Review–95-002) **Annual report of the Osaka Laboratory for Radiation Chemistry Japan Atomic Energy Research Institute, (No. 27). April 1, 1993 - March 31, 1994.** Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 68p. Order Number DE95789323. Source: OSTI; NTIS; INIS.

The annual research activities of Osaka Laboratory for Radiation Chemistry, JAERI during the fiscal year of 1993 (April 1, 1993 - March 31, 1994) are described. The research activities were conducted under the two research programs; the study on laser-induced organic chemical reactions and the study on basic radiation technology for functional materials. Detailed descriptions of the activities are presented in the following subjects: laser-induced organic synthesis, modification of polymer surface by laser irradiation, radiation-induced polymerization, preparation of fine particles by gamma ray irradiation, and electron beam dosimetry. The operation report of the irradiation facilities is also included. (author).

24938 (LA-SUB–95-36-Vol.1) **[Trip report of travel to Las Vegas to consider specification for the Integrated Data System (IDS) with administrative memos]. Volume 1, FY92–FY93.** Hall, J. (Computer Applications Group, Inc., Carlton, OR (United States)). Lawrence Livermore National Lab., CA (United States); Computer Applications Group, Inc., Carlton, OR (United States). 15 Dec 1994. 336p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95013476. Source: OSTI; NTIS; GPO Dep.

This document is a compilation of travel reports and memorandums that are the results of planning between Los Alamos National Laboratory and Computer Applications Group, Inc.

24939 (LBL-PUB–5409) **Lawrence Berkeley Laboratory FY 1995 site development plan.** Lawrence Berkeley Lab., CA (United States). 14 Apr 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95011277. Source: OSTI; NTIS; GPO Dep.

This report is a site development plan detailing the mission of LBL, its workload and site population, program projections and requirements, master plans, and management considerations.

24940 (RFP–4902) **10 CFR 830.120 Criterion 10, Independent Assessment: We're here to help you!.** Farrell, R.E. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90RF62349. (CONF-950601–15: Annual meeting of the American Nuclear Society (ANS), Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95014003. Source: OSTI; NTIS; INIS; GPO Dep.

Each organization performing activities in the DOE Weapons Complex is required to have an pendent assessment function. This is consistent from DOE Order 5700.6C, Quality Assurance to 10 CFR 830-120, sometimes referred to as the Price-Anderson rule. DOE Order 5700.6C, Criterion 10 Independent Assessment requires, " Planned and periodic independent assessments shall be conducted to measure item quality and process effectiveness and to promote improvement. The organization performing independent assessments shall have sufficient authority and freedom from the line organization to carry out its responsibilities. Persons conducting independent assessments shall be technically qualified and knowledgeable in the areas assessed." 10 CFR 830.120, (c) Quality assurance criteria – (3) Assessment – (ii) Independent Assessment requires,"Independent assessments shall be planned and conducted to measure item and service quality, to measure the adequacy of work performance, and to promote improvement. The group performing independent assessments shall have sufficient authority and freedom from the line to carry out its responsibilities. Persons conducting independent assessments shall be technically qualified and knowledgeable in the areas assessed."

24941 (SAND–94-2328/1) **Research methods to develop measures of effectiveness of the United States Coast Guard's Vessel Inspection and Boarding Program, Volume 1 - executive summary.** Wheeler, T. (Sandia National Labs., Albuquerque, NM (United States)); Cox, R.; Gawande, K. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014530. Source: OSTI; NTIS; GPO Dep.

The primary objective of this study is to provide Measures of Effectiveness (MOEs) of the U.S. Coast Guard Marine Inspection and Boarding Program based on objective scientific methods. A secondary objective of the study is to provide USCG management with a methodologically and theoretically sound aid to effective policy decision-making. The MOEs constructed in this study are specific to the Marine Inspection and Boarding Program, but the methodology of the study is based on sound theoretical principles that are probably applicable to a range of USCG activities. Hence the methodology applies equally to other important USCG programs and can be similarly used to measure their effectiveness and as an aid to decision-making.

24942 (SAND–95-0328C) **Selecting a risk-based tool to aid in decision making.** Bendure, A.O. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950740–68: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95007737. Source: OSTI; NTIS; GPO Dep.

Selecting a risk-based tool to aid in decision making is as much of a challenge as properly using the tool once it has been selected. Failure to consider customer and stakeholder requirements and the technical bases and differences in risk-based decision making tools will produce confounding and/or politically unacceptable results when the tool is used. Selecting a risk-based decisionmaking tool must therefore be undertaken with the same, if not greater, rigor than the use of the tool once it is selected. This paper presents a process for selecting a risk-based tool appropriate to a set of prioritization or resource allocation tasks, discusses the results of applying the process to four risk-based decision-making tools, and identifies the "musts" for successful selection and implementation of a risk-based tool to aid in decision making.

24943 (SAND–95-0845) **The vital issues process: Strategic planning for a changing world.** Engi, D.; Glicken, J. Sandia National Labs., Albuquerque, NM (United States). May 1995. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012529. Source: OSTI; NTIS; GPO Dep.

The Vital Issues process (VIp) is a strategic planning tool initially developed by Sandia National Laboratories (SNL) for the Office of Foreign Intelligence (OFI)" of the US Department of Energy (DOE). It was further developed and refined through its application to a variety of strategic purposes for a range of public and semipublic organizations. The VIp provides a structured mechanism for assisting organizations in accomplishing specified objectives by identifying and prioritizing a portfolio of strategic issues, programmatic areas, or responses to a specified problem. It employs day-long panel meetings in a specified format to elicit a broad range of perspectives on a particular issue in a nonconfrontational manner and to facilitate the interaction and synthesis of diverse viewpoints on a specific topic. The VIp is unique in its incorporation of two primary approaches in each panel session: a qualitative or transactional segment, which entails the synthesis of the alternatives through negotiations or discussion, and a quantitative or net benefit maximization segment, an analytical approach, which involves prioritization of the alternatives using pairwise comparisons. This combination of facilitated group discussion and quantitative ranking provides input to strategic management decisions in the form of stakeholder-defined and -prioritized items as well as information on potential barriers to the implementation of policies and programs. This is the final volume in the series Identifying Vital Issues: New Intelligence Strategies for a New World, a three-volume set that gives an accounting of the VIp as implemented for OFI. This volume provides an in-depth description of the methodology used in the VIp.

24944 (SAND–95-0908C) **Communicating in a multi-project environment with a single-sheet project plan.** Furaus, J.P.; Figueroa-McInteer, C.; Glidewell, D.D.; McKeever, P.S.; Hendrick, W.E.; Wisler, D.B.; Zavadil, J.T. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9510171–2: PMI '95: Project Management Institute conference, New Orleans, LA (United States), 13-19 Oct 1995). Order Number DE95013887. Source: OSTI; NTIS; GPO Dep.

In June 1992, the Corporate Construction Program Office was formed to provide single-point accountability for managing all corporate-sponsored construction projects at Sandia, answering to upper Sandia management as well as Sandia's primary external customer, the U.S. DOE. CCPO had 3 major areas of responsibility: Congressional line-item projects (>$2 million), general plant projects (<$2 million), and corporate-funded major rearrangements (renovations). A single-sheet project plan ("summary sheet"), with monthly updates, was developed for every project. Each month, the sheets are duplicated and placed in a "project summary book" that is distributed through various communication channels at Sandia. Despite many modifications, the summary sheet has remained simple and useful to a broad range of project stakeholders. This paper describes how the sheet's design and implementation enhances communication across Sandia's complex, multi-program environment.

24945 (SAND–95-0937) **1994 Ergonomics Program Quality Evaluation.** Longbotham, L.; Miller, D.P. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015439. Source: OSTI; NTIS; GPO Dep.

A telephone survey was conducted to evaluate the quality of service provided to the primary customers of the Corporate Ergonomics Group (CEG). One hundred clients who received services between October 1993 and June 1994 were asked questions

on their expectations, implementation of ergonomic recommendations, follow-ups, time required, productivity improvements, symptom alleviation, and satisfaction. Suggestions on how processes could be improved were also solicited. In general, recommendations are being implemented, worksite evaluations are going smoothly, and customers are satisfied with the process. The CEG was pleased to learn that half of the people who implemented recommendations experienced improvements in productivity, and four out of five symptomatic customers experienced partial or complete relief. Through analysis of the data and by studying clients' suggestions for process improvement, the CEG has developed a strategy for changing and improving current procedures and practices. These plans can be found in the last section of this report.

24946 (SAND–95-0942C) **Power of a shared vision.** Furaus, J.P.; Baca, A.M.; Corbett, D.W.; Everett, J.J.; Faturos, T.V.; Harrison, S.J.; Hartzell, R.; Lucero, F.C. Jr.; Oliver, P. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9510171–3: PMI '95: Project Management Institute conference, New Orleans, LA (United States), 13-19 Oct 1995). Order Number DE95014853. Source: OSTI; NTIS; GPO Dep.

Management activities and ideas at Sandia National Laboratories are presented. Jim Jacobs provided a firm foundation for facilities management from 1991 to 1993 by organizing the following three entities: the program management center, the facilities development center, and the operations and maintenance center. The continuance of these three streamlining mechanisms and an emphasis on program councils dictated by Neil Hartwigsen ensure an efficiently run Laboratory. Plans and results are described.

24947 (SSCL-SR–1217) **Superconducting Super Collider site environmental report for calendar year 1991. Pre-operational.** Superconducting Super Collider Lab., Dallas, TX (United States). [1995]. 131p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011209. Source: OSTI; NTIS; INIS; GPO Dep.

This is the first annual SER prepared for the SSC project. It is a pre-operational report, intended primarily to describe the baseline characterization of the Ellis County, Texas site that has been developed subsequent to the Environmental Impact Statement (EIS) and the Supplemental Environmental impact Statement (SEIS). As such, the emphasis will be on environmental compliance efforts, including monitoring and mitigation programs. The SER also reports on the measures taken to meet the commitments made in the EIS and SEIS. These measures are detailed in the Mitigation Action Plan (MAP) (Department of Energy (DOE), 1991), which was prepared following the signing of the Record of Decision (ROD) to construct the SSC in Texas. The SER will continue to be preoperational until the first high-energy (20 trillion electron volt or TeV) protons collisions are observed, at which point the SSC will become operational. At that time, the SER will place more emphasis on the radiological monitoring program. This SER will report on actions taken in 1991 or earlier and briefly mention some of those planned for calendar year 1992. AU actions completed in 1992 will be addressed in the SER for calendar year 1992.

24948 (UCRL-ID–116187-94-10) **The Mixed Waste Management Facility monthly report, October 1994.** Streit, R. Lawrence Livermore National Lab., CA (United States). Nov 1994. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013308. Source: OSTI; NTIS; GPO Dep.

During October, significant progress was made on both the management and technical activities of the Project. These activities were accomplished within the scope and effort described in the MWMF FY95 Plan (currently in draft within the Project), which reflects the reduced DOE FY95 funding guidance received September 29, 1994. DOE/OAK approved Revision 1 of the MWMF Baseline (reflecting KD-1 guidance), thus providing a basis for Revision 2 (reflecting DWTF/MWW integration). Considerable management and senior-engineering resources were directed toward addressing the issues that are summarized below. The proposed technical scope and schedule for the FY95 Plan was largely completed during October, along with consistent (but less detailed) tasks and estimates for the remainder of the project; this latter information will also be used as a basis for the Rebaseline. However, the FY95 Plan cannot be finalized until mid-November when LLNL tax rates will be established. MWMF project personnel completed most of the input and draft documentation required by the LLNL permitting group to prepare the modified RD&D permit application that reflects the DWTF/MWMF integration. The PSAR continued through the LLNL approval chain. Revisions to the EA began to reflect the DWTF/MWMF integration. Two significant reviews of the project were addressed: the DOE Office of the Inspector General (OIG) and the Options Analysis Team (OAT). Draft documents were prepared and discussed with DOE/OAK and HQ to provide for a coordinated response.

24949 (WHC-SD-GN-CSWD–30077) **Hanford Action Tracking System release planning support documents.** Keasling, R. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012584. Source: OSTI; NTIS; GPO Dep.

This document contains impacts, plans, resource requirements, schedules, and documents to ensure the conduct of activities for the operation of the Hanford Action Tracking System (HATS). Each discrete topic in this document applies to a specific area of management and team interaction. These formally establish the planning, resources, documentation, and training responsibilities for the system management team. This document is composed of four appendices. These include the following: (1) organization impacts and implementation plan–expected organizational impacts resulting from setting up the new support system for the HATS, the plan to address each of these impacts and other system implementation requirements; (2) training and information requirements–training and information needed to use and operate the HATS; (3) operation/maintenance resources–resources required to maintain and operate the HATS once the system becomes operations; (4) training package–HATS implementation training needs, includes a training procedure, the environment for training users (tools and materials required for the facility, trainer, and trainee); schedule, and handout materials and forms to be completed at the time of training.

24950 (ANL/CHM/CP–86617) **Parallel computing in quantum chemistry – Message passing and beyond for a general ab initio program system.** Lischka, H. (Univ. of Vienna (Austria). Inst. fuer Theoretische Chemie und Strahlenchemie); Dachsel, H.; Shepard, R.; Harrison, R.J. Argonne National Lab., IL (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States);Fund for Advancement of Scientific Research in Austria (Austria). DOE Contract W-31109-ENG-38. Project P9032. (CONF-940301–48: 207. spring national meeting of the American Chemical Society (ACS), San Diego, CA (United States), 13-18 Mar 1994). Order Number DE95013463. Source: OSTI; NTIS; GPO Dep.

One of the most prominent aims in Computational Chemistry is the modeling of chemical reactions and the prediction of molecular properties. Quantum chemical methods are used for the calculation of molecular structures, spectra, reaction energy profiles and many other interesting quantities. Nowadays, the accuracy of the theoretical calculations can compete to an increasing extent with the experimental one. A great variety of quantum chemical methods

exist ranging from the standard Hartree-Fock theory to sophisticated electron correlation approaches. From a computational point of view all these methods require rather lengthy and complicated program codes and have to handle a large amount of data to be stored on external devices. In the simplest case, the Hartree-Fock (SCF) method, "direct" algorithms have eliminated the I/O and storage bottleneck and have opened the way to parallel implementations. For post-Hartree-Fock methods the situation is much more complicated as will be demonstrated below. Therefore, most of the previous attempts in parallelizing quantum chemical ab initio programs concentrated on SCF methods. The authors investigations presented here are a continuation of their previous work on the parallelization of the COLUMBUS program system. The COLUMBUS program is based on the multireference single- and double-excitation configuration interaction (MRSDCI) approach. It is very portable and runs on a large variety of computers including numerous Unix-based workstations, VAX/VMS minicomputers, IBM mainframes and Cray supercomputers.

24951 (ANL/EA/CP–86212) **A simplified model to estimate radiological doses from incineration of radioactive waste.** Stevens, L.E. (USDOE, Washington, DC (United States)); Ma, C.W.; Wheeler, T.; Nimmagadda, M.; LePoire, D.; Chen, S.Y.; Owens, K.W. Argonne National Lab., IL (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950542–1: 14. international symposium on thermal treatment technologies: incineration conference, Seattle, WA (United States), 8-12 May 1995). Order Number DE95013413. Source: OSTI; NTIS; INIS; GPO Dep.

A simplified calculational model permits a rapid yet realistic estimate of small, but potential radiological doses to onsite workers and the offsite public as a result of transportation, handling, storage, incineration, and maintenance of waste containing trace amount of radioactive materials which is to be processed at a treatment, storage, and disposal (TSD) facility. The model was developed on the basis of previous detailed studies of eight TSD facilities and builds in the essential features of a TSD facility. The model would provide an understanding of the potential human exposure associated with the radioactive contents in the chemical wastes.

24952 (ANL/MCS/CP–86036) **An introduction to performance debugging for parallel computers – fast.** Gropp, W. Argonne National Lab., IL (United States). 7 Feb 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9405327–1: ICASE/LaRC workshop on parallel numerical algorithms, Norfolk, VA (United States), 23-25 May 1994). Order Number DE95013383. Source: OSTI; NTIS; GPO Dep.

Programming parallel computers for performance is a difficult task that requires careful attention to both single-node performance and data exchange between processors. This paper discusses some of the sources of poor performance, ways to identify them in an application, and a few ways to address these issues.

24953 (ANL/MCS/CP–86446) **Automatic differentiation: Obtaining fast and reliable derivatives – fast.** Bischof, C.H. (Argonne National Lab., IL (United States). Mathematics and Computer Science Div.); Khademi, P.M.; Pusch, G.; Carle, A. Argonne National Lab., IL (United States). [1994]. 17p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. Agreement NCCW-0027; Agreement CCR-9120008. (CONF-9407190–1: SIAM symposium on control problems in industry, San Diego, CA (United States), 22-23 Jul 1994). Order Number DE95014244. Source: OSTI; NTIS; GPO Dep.

In this paper, the authors introduce automatic differentiation as a method for computing derivatives of large computer codes. After a brief discussion of methods of differentiating codes, they review automatic differentiation and introduce the ADIFOR (Automatic DIfferentiation of FORtran) tool. They highlight some applications of ADIFOR to large industrial and scientific codes (groundwater transport, CFD airfoil design, and sensitivity-enhanced MM5 mesoscale weather model), and discuss the effectiveness and performance of their approach. Finally, they discuss sparsity in automatic differentiation and introduce the SparsLinC library.

24954 (ANL/MCS/CP–86648) **An interactive virtual environment for finite element analysis.** Bradshaw, S. (Argonne National Lab., IL (United States). Mathematics Computer Science Div.); Canfield, T.; Kokinis, J.; Disz, T. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950431–3: High performance computing '95, Tucson, AZ (United States), 9-13 Apr 1995). Order Number DE95013441. Source: OSTI; NTIS; GPO Dep.

Virtual environments (VE) provide a powerful human-computer interface that opens the door to exciting new methods of interaction with high-performance computing applications in several areas of research. The authors are interested in the use of virtual environments as a user interface to real-time simulations used in rapid prototyping procedures. Consequently, the authors are developing methods for coupling finite element models of complex mechanical systems with a VE interface for real-time interaction.

24955 (ANL/MCS-TM–195) **Using ADIFOR 1.0 to compute Hessians.** Hovland, P. Argonne National Lab., IL (United States). Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95014521. Source: OSTI; NTIS; GPO Dep.

Technical Memorandum Number 195.

ADIFOR provides a simple means to produce code for the first derivatives of functions through the technique of automatic differentiation. However, the fact that ADIFOR currently cannot produce code to compute second derivatives limits its usefulness for certain applications. This paper describes how ADIFOR and related tools can be used to produce code that does compute second derivatives and discusses how to use this code. Conclusions are presented about the limitations of this method and how it might compare with second-derivative code produced directly by ADIFOR.

24956 (ANL/MCS-TM–207) **Users manual for tohtml: Producing true hypertext documents from LaTeX.** Gropp, W. Argonne National Lab., IL (United States). Mar 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95012980. Source: OSTI; NTIS; GPO Dep.

The World Wide Web has made it possible to—use and disseminate documents as "hypertext." One of the major advantages of hypertext over conventional text is that references to other documents or items can be linked directly into the document, allowing the easy retrieval of related information. A collection of documents can also be read this way, jumping from one document to another based on the interests of the reader. This does require that the hypertext documents be extensively cross-linked. Unfortunately, most existing documents are designed as linear documents. Even worse, most authors still think of documents as linear structures, to be read from front to back. To deal with this situation, a number of tools have been created that take documents in an existing word-processing system or markup language and generate "HTML," the hypertext markup language used on the Web. While this process makes a single document available in a convenient form on the Web, it does not give access to cross-document linking, a major advantage of hypertext. This manual describes a program, tohtml, that takes LaTeX input files, as well as files of link information, and produces a hypertext document that can contain extensive cross-links. A related program, doctext, aids in the generation of manual pages that can be referenced by a LaTeX document.

24957 (ANL/RE/CP–86223) **Enrichment of the finite element method with reproducing kernel particle method.** Chen, Y. (Northwestern Univ., Evanston, IL (United States). Mechanical Engineering Dept.); Liu, W.K.; Uras, R.A. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950740–55: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014248. Source: OSTI; NTIS; GPO Dep.

Based on the reproducing kernel particle method on enrichment procedure is introduced to enhance the effectiveness of the finite element method. The basic concepts for the reproducing kernel particle method are briefly reviewed. By adopting the well-known completeness requirements, a generalized form of the reproducing

kernel particle method is developed. Through a combination of these two methods their unique advantages can be utilized. An alternative approach, the multiple field method is also introduced.

24958 (ANL/RE/CP–86314) **On mesh rezoning algorithms for parallel platforms.** Plaskacz, E.J. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950740–58: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014243. Source: OSTI; NTIS; GPO Dep.

A mesh rezoning algorithm for finite element simulations in a parallel-distributed environment is described. The cornerstones of the algorithm are: the parallel computation of distortion norms on the element and subdomain level, the exchange of the individual subdomain norms to form a subdomain distortion vector, the classification of subdomains and the rezoning behavior prescribed within each subdomain as a response to its own classification and the classification of neighboring subdomains.

24959 (ANL/RE/CP–86315) **Structural mechanics computations on parallel computing platforms.** Kulak, R.F.; Plaskacz, E.J.; Pfeiffer, P.A. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950740–53: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95013520. Source: OSTI; NTIS; INIS; GPO Dep.

With recent advances in parallel supercomputers and network-connected workstations, the solution to large scale structural engineering problems has now become tractable. High-performance computer architectures, which are usually available at large universities and national laboratories, now can solve large nonlinear problems. At the other end of the spectrum, network connected workstations can be configured to become a distributed-parallel computer. This approach is attractive to small, medium and large engineering firms. This paper describes the development of a parallelized finite element computer program for the solution of static, nonlinear structural mechanics problems.

24960 (CONF-9410335–, pp. 10-15) **What is computational intelligence?** Bezdek, J.C. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

This not is about neural-like computational networks, numerical pattern recognition and intelligence. Its purpose is to record my ideas about the notions of computational, artificial and biological intelligence, and the semantics we use to describe them. Perhaps a dialog about the term "intelligent systems" will guide us towards rational expectations about models that try to mimic this aspect of human behavior.

24961 (CONF-9410335–, pp. 16-37) **Foundations of neural networks.** Simpson, P.K. (General Dynamics Electronics Division, San Diego, CA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

Building intelligent systems that can model human behavior has captured the attention of the world for years. So, it is not surprising that a technology such as neural networks has generated great interest. This paper will provide an evolutionary introduction to neural networks by beginning with the key elements and terminology of neural networks, and developing the topologies, learning laws, and recall dynamics from this infrastructure. The perspective taken in this paper is largely that of an engineer, emphasizing the application potential of neural networks and drawing comparisons with other techniques that have similar motivations. As such, mathematics will be relied upon in many of the discussions to make points as precise as possible. The paper begins with a review of what neural networks are and why they are so appealing. A typical neural network is immediately introduced to illustrate several of the key features. With this network as a reference, the evolutionary introduction to neural networks is then pursued. The fundamental elements of a neural network, such as input and output patterns, processing element, connections, and threshold operations, are described, followed by descriptions of neural network topologies, learning algorithms, and recall dynamics. A taxonomy of neural networks is presented that uses two of the key characteristics of learning and recall. Finally, a comparison of neural networks and similar nonneural information processing methods is presented.

24962 (CONF-9410335–, pp. 38-50) **Nonlinear PLS modeling using neural networks.** Qin, S.J. (Univ. of Maryland, College Park, MD (United States)); McAvoy, T.J. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

This paper discusses the embedding of neural networks into the framework of the PLS (partial least squares) modeling method resulting in a neural net PLS modeling approach. By using the universal approximation property of neural networks, the PLS modeling method is genealized to a nonlinear framework. The resulting model uses neural networks to capture the nonlinearity and keeps the PLS projection to attain robust generalization property. In this paper, the standard PLS modeling method is briefly reviewed. Then a neural net PLS (NNPLS) modeling approach is proposed which incorporates feedforward networks into the PLS modeling. A multi-input-multi-output nonlinear modeling task is decomposed into linear outer relations and simple nonlinear inner relations which are performed by a number of single-input-single-output networks. Since only a small size network is trained at one time, the over-parametrized problem of the direct neural network approach is circumvented even when the training data are very sparse. A conjugate gradient learning method is employed to train the network. It is shown that, by analyzing the NNPLS algorithm, the global NNPLS model is equivalent to a multilayer feedforward network. Finally, applications of the proposed NNPLS method are presented with comparison to the standard linear PLS method and the direct neural network approach. The proposed neural net PLS method gives better prediction results than the PLS modeling method and the direct neural network approach.

24963 (CONF-9410335–, pp. 51-56) **Nonlinear principal components analysis–based on principal curves and neural networks.** Dong, D. (Univ. of Maryland, College Park, MD (United States)); McAvoy, T.J. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

Many applications of principal component analysis (PCA) can be found in recently published papers. But principal component analysis is a linear method, and most engineering problems are nonlinear. Sometimes using the linear PCA method in nonlinear problems can bring distorted and misleading results. So there is a need for a nonlinear principal component analysis (NLPCA) method. The principal curve algorithm was a breakthrough of solving the NLPCA problem, but the algorithm does not yield an NLPCA model which can be used for predictions. In this paper we

present a NLPCA method which integrates the principal curve algorithm and neural networks. The results on both simulated and real problems show that the method is excellent for solving nonlinear principal component problems. Potential applications of NLPCA are also discussed in this paper.

24964 (CONF-9410335–, pp. 57-65) **Soft computing and fuzzy logic.** Zadeh, L.A. (Univ. of California, Berkeley, CA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. Grant NCC-2-275; Grant RP 8010-34. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

Soft computing is a collection of methodologies that aim to exploit the tolerance for imprecision and uncertainty to achieve tractability, robustness, and low solution cost. Its principal constituents are fuzzy logic, neuro-computing, and probabilistic reasoning. Soft computing is likely to play an increasingly important role in many application areas, including software engineering. The role model for soft computing is the human mind.

24965 (CONF-9410335–, pp. 66-75) **Fuzzy logic controllers: From development to deployment.** Bonissone, P.P. (General Electric Corporate R&D, Schenectady, NY (United States)); Chiang, K.H. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

We view fuzzy logic control technology as a high level language in which we can efficiently define and synthesize non-linear controllers for a given process. We contrast fuzzy Proportional Integral (PI) controllers with conventional PI and two dimensional sliding mode controllers. Then we compare the development of Fuzzy Logic Controllers (FLC) with that of Knowledge Based System (KBS) applications. We decompose the comparison into reasoning tasks (representation, inference, and control) and application tasks (acquisition, development, validation, compilation, and deployment). After reviewing the reasoning tasks, we focus on the compilation of fuzzy rule bases into fast access lookup tables. These tables can be used by a simplified run-time engine to determine the TLC's crisp output for a given input.

24966 (CONF-9410335–, pp. 76-91) **Industrial Applications of Fuzzy Logic at General Electric.** Bonissone, P.P. (General Electric Corporate Research and Development, Schenectady, NY (United States)); Badami, V.; Chiang, K.H.; Khedkar, P.S.; Marcelle, K.W.; Schutten, M.J. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. Contract RP8004-25. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

Fuzzy Logic Control (FLC) technology has drastically reduced the development time and deployment cost for the synthesis of nonlinear controllers for dynamic systems. As a result we have experienced an increased number of FLC applications. We will illustrate some of our efforts in FLC technology transfer, covering projects in turboshaft aircraft engine control, steam turbine startup, steam turbine cycling optimization, resonant converter power supply control, and data-induced modeling of the nonlinear relationship between process variables in a rolling mill stand. We will compare these applications in a cost/complexity framework, and examine the driving factors that led to the use of FLCs in each application. We will emphasize the role of fuzzy logic in developing supervisory controllers and in maintaining explicit tradeoff criteria used to manage multiple control strategies. Finally, we will describe some of our FLC technology research efforts in automatic rule base tuning and generation, leading to a suite of programs for reinforcement learning, supervised learning, genetic algorithms, steepest descent algorithms, and rule clustering.

24967 (CONF-9410335–, pp. 92-101) **Overview of exploratory research in adaptive control systems at the Electric Power Research Institute.** Wildberger, A.M. (Electric Power Research Institute, Palo Alto, CA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

Exploratory Research in Adaptive Control Systems at the Electric Power Research Institute (EPRI) attempts to combine the goal of finding innovative and valuable applications specific to the electric power industry with the equally important goal of establishing fundamental theory or reliable procedures for the design and development of adaptive and intelligent systems. The largest block of this research consists of twenty-one projects that make up the "Intelligent Control Systems (ICS) Initiative," jointly funded by EPRI and the National Science Foundation (NSF). Most of these projects began in 1993 and will continue for three years. The rest of EPRI's Exploratory Research projects, that address adaptive control in general, are part of the program in Applied Mathematics and Information Science (AM&IS). This area emphasizes fundamental theory and design procedures. However, the AM&IS program also includes projects that seek to invent and test new techniques and new applications whose success appears relatively risky at the beginning of the project.

24968 (CONF-9410335–, pp. 102-116) **EPA's adaptive controls system research program for pollution prevention and clean technologies.** Spiegel, R.J. (Environmental Protection Agency, Research Triangle Park, NC (United States)); Chappell, P.J.; Miller, C.A. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

The current effort of EPA's control systems research is concentrated in three areas: electric motors, wind turbines, and combustion technologies. In general, these projects are concerned with pollution prevention through enhanced efficiency of operation and pollution control through lower emission levels. Pioneering effort has been achieved in the application of fuzzy-logic-based controls in these areas. Based on the results of these projects, fuzzy logic has emerged as an important tool in environmental technology for pollution elimination and control.

24969 (CONF-9410335–, pp. 117-148) **Genetic Algorithms: A gentle introduction.** Jong, K.D. (George Mason Univ., Fairfax, VA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

Information is presented on genetic algorithms in outline form. The following topics are discussed: how are new samples

generated, a genotypic viewpoint, a phenotypic viewpoint, an optimization viewpoint, an intuitive view, parameter optimization problems, evolving production rates, genetic programming, GAs and NNs, formal analysis, Lemmas and theorems, discrete Walsh transforms, deceptive problems, Markov chain analysis, and PAC learning analysis.

24970 (CONF-9410335–, pp. 149-152) **Genetic algorithms.** Grefenstette, J.J. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

Genetic algorithms solve problems by using principles inspired by natural population genetics: They maintain a population of knowledge structures that represent candidate solutions, and then let that population evolve over time through competition and controlled variation. GAs are being applied to a wide range of optimization and learning problems in many domains.

24971 (CONF-9410335–, pp. 153-158) **Test and evaluation by genetic algorithms.** Schultz, A.C.; Grefenstette, J.J.; Jong, K.A. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

Autonomous vehicles will require sophisticated software controllers. Given a vehicle simulation and an intelligent controller for that vehicle, what methods are available for testing the controller's robustness? Validation and verification are enough: The controller might perform as specified, but the specifications could be incorrect; that is, the vehicle might not behave as expected. Testing all possible situations is obviously intractable. And techniques for testing isolated, low-level controllers do not apply to the vehicle as a whole. Also, traditional controller tests are labor intensive and time consuming. Some methods require simulated vehicle missions to test the controller's robustness under various conditions. After designing a fault scenario that will cause particular failures during a simulated mission, the test engineers observe the vehicle's resulting behavior and then refine the fault scenario to better exercise the controller. This cycle is repeated until the engineers are confident that the vehicle's behavior will be appropriate in the field. Implicitly, the engineers are searching for interesting fault scenarios.

24972 (CONF-9410335–, pp. 159-165) **First flights of genetic-algorithm Kitty Hawk.** Goldberg, D.E. (Univ. of Illinois, Urbana, IL (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

The design of complex systems requires an effective methodology of invention. This paper considers the methodology of the Wright brothers in inventing the powered airplane and suggests how successes in the design of genetic algorithms have come at the hands of a Wright-brothers-like approach. Recent reliable subquadratic results in solving hard problems with nontraditional GAs and predictions of the limits of simple GAs are presented as two accomplishments achieved in this manner.

24973 (CONF-9410335–, pp. 166-171) **Strategy for adaptive process control for a column flotation unit.** Karr, C.L.; Ferguson, C.R. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

Researchers at the U.S. Bureau of Mines (USBM) have developed adaptive process control systems in which genetic algorithms (GAs) are used to augment fuzzy logic controllers (FLCs). Together, GAs and FLCs possess the capabilities necessary to produce powerful, efficient, and robust adaptive control systems. To perform efficiently, such control systems require a control element to manipulate the problem environment, an analysis element to recognize changes in the problem environment, and a learning element to adjust to the changes in the problem environment. In this paper, the details of an ongoing research effort to develop and implement an adaptive process control system for a column flotation unit are discussed. Column flotation units are used extensively in the mineral processing industry to recover valuable minerals from their ores.

24974 (CONF-9410335–, pp. 172-185) **Assuring the performance of adaptive control systems.** Wildberger, A.M. (Electric Power Research Institute, Palo Alto, CA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

Assuring the stability, robustness and completeness of any control system is difficult enough, but if the system includes any form of artificial intelligence that allows it to adapt or learn while it is operating, such assurance creates new, and perhaps unsolvable, problems. This paper examines some of the theoretical and practical bases underlying these problems and discusses some current research directed toward overcoming them. One pragmatic approach attempts to automate a guaranteed optimal design and/or automate post-design testing by the use of evolutionary programming and genetic algorithms. Ideally, it would be preferable to provide formal proofs and quantitative design criteria similar to those available for linear feedback control systems. Ultimately, the complete solution of these problems may require new mathematical developments in the area of non-additive measure theory, non-linear dynamics, and the understanding of complexity and adaptation in general.

24975 (CONF-9410335–, pp. 186-212) **Fuzzy models for pattern recognition.** Bezdek, J.C.; Sankar K. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

FUZZY sets were introduced in 1965 by Lotfi Zadeh as a new way to represent vagueness in everyday life. They are a generalization of conventional set theory, one of the basic structures underlying computational mathematics and models. Computational pattern recognition has played a central role in the development of fuzzy models because fuzzy interpretations of data structures are a very natural and intuitively plausible way to formulate and solve various problems. Fuzzy control theory has also provided a wide variety of real, fielded system applications of fuzzy technology. We shall have little more to say about the growth of fuzzy models in control, except to the extent that pattern recognition algorithms and methods described in this book impact control systems. Collected here are many of the seminal papers in the field. There will be, of

course, omissions that are neither by intent nor ignorance; we cannot reproduce all of the important papers that have helped in the evolution of fuzzy pattern recognition (there may be as many as five hundred) even in this narrow application domain. We will attempt, in each chapter introduction, to comment on some of the important papers that not been included and we ask both readers and authors to understand that a book such as this simply cannot "contain everything." Our objective in Chapter 1 is to describe the basic structure of fuzzy sets theory as it applies to the major problems encountered in the design of a pattern recognition system.

24976 (CONF-9410335–, pp. 213-221) **Application of neural networks for control of chaotic systems.** Mulpur, A. (Visual Solutions, Inc., Westford, MA (United States)); Mulpur, S. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

This paper investigates the feasibility of alternative and more general ways to control nonlinear and chaotic systems, based on Artificial Neural Networks (ANN). A chaotic system model is considered and a neural network is trained to serve as an intelligent controller for the system. During the training phase, a conventional controller is used as the teacher. The neural controller is placed in the closed loop after the training phase. Simulation results indicate that the neural net controller performs satisfactorily, compared to conventional closed-loop controllers.

24977 (CONF-9410337–1) **An MPI version of the BLACS.** Walker, D.W. Oak Ridge National Lab., TN (United States). [1994]. 19p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. DAAL03-91-C-0047. From Scalable parallel libraries conference; Starksville, MS (United States); 12-14 Oct 1994. Order Number DE95010291. Source: OSTI; NTIS; GPO Dep.

In this paper, issues related to implementing an MPI version of the Basic Linear Communication Subprograms (BLACS) are investigated. A set of routines, the MPI Linear Algebra Communication Subprograms (MLACS), are presented, and these arc used to implement an MPI version of the BLACS, The MLACS provide the same functionality as the BLACS, but extend the functionality of the BLACS to include both blocking and nonblocking communication, and all four of the MPI communication modes.

24978 (CONF-950534–4) **Virtual laboratories: Collaborative environments and facilities-on-line.** Thomas, C.E. Jr. (Oak Ridge National Lab., TN (United States). I and C Div.); Cavallini, J.S.; Seweryniak, G.R.; Kitchens, T.A.; Hitchcock, D.A.; Scott, M.A.; Welch, L.C.; Aiken, R.J. Oak Ridge National Lab., TN (United States). [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on real-time computer applications in nuclear, particle and plasma physics (RT); East Lansing, MI (United States); 22-26 May 1995. Order Number DE95014596. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) has major research laboratories in a number of locations in the US, typically co-located with large research instruments or research facilities valued at tens of millions to even billions of dollars. Present budget exigencies facing the entire nation are felt very deeply at DOE, just as elsewhere. Advances over the last few years in networking and computing technologies make virtual collaborative environments and conduct of experiments over the internetwork structure a possibility. The authors believe that development of these collaborative environments and facilities-on-line could lead to a "virtual laboratory" with tremendous potential for decreasing the costs of research and increasing the productivity of their capital investment in research facilities. The majority of these cost savings would be due to increased productivity of their research efforts, better utilization of resources and facilities, and avoiding duplication of expensive facilities. A vision of how this might all fit together and a discussion of the infrastructure necessary to enable these developments is presented.

24979 (DOE/ER/25138–T1) **The use of symbolic computation in radiative, energy, and neutron transport calculations. Technical report, 15 August 1992–14 August 1994.** Frankel, J.I. Florida Inst. of Tech., Melbourne, FL (United States). Dept. of Mechanical and Aerospace Engineering. [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-92ER25138. Order Number DE95013078. Source: OSTI; NTIS; INIS; GPO Dep.

This investigation uses symbolic computation in developing analytical methods and general computational strategies for solving both linear and nonlinear, regular and singular, integral and integro-differential equations which appear in radiative and combined mode energy transport. This technical report summarizes the research conducted during the first nine months of the present investigation. The use of Chebyshev polynomials augmented with symbolic computation has clearly been demonstrated in problems involving radiative (or neutron) transport, and mixed-mode energy transport. Theoretical issues related to convergence, errors, and accuracy have also been pursued. Three manuscripts have resulted from the funded research. These manuscripts have been submitted to archival journals. At the present time, an investigation involving a conductive and radiative medium is underway. The mathematical formulation leads to a system of nonlinear, weakly-singular integral equations involving the unknown temperature and various Legendre moments of the radiative intensity in a participating medium. Some preliminary results are presented illustrating the direction of the proposed research.

24980 (DOE/ET/53088–689) **Exactly conservative integrators.** Shadwick, B.A.; Bowman, J.C.; Morrison, P.J. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. 19 Jul 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. Order Number DE95015448. Source: OSTI; NTIS; GPO Dep.

Traditional numerical discretizations of conservative systems generically yield an artificial secular drift of any nonlinear invariants. In this work we present an explicit nontraditional algorithm that exactly conserves invariants. We illustrate the general method by applying it to the Three-Wave truncation of the Euler equations, the Volterra-Lotka predator-prey model, and the Kepler problem. We discuss our method in the context of symplectic (phase space conserving) integration methods as well as nonsymplectic conservative methods. We comment on the application of our method to general conservative systems.

24981 (ENEA-RT-AMB–94-22) **Analceos software for analysis of ERS-1 altimeter data: implementation of new module to extract data from selected area.** Lisca, A. (ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute); Vignudelli, S. ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute. Sep 1994. 72p. Order Number DE95789769. Source: OSTI; NTIS (US Sales Only).

The present technical report reviews the characteristics of the ERS-1 altimeter and the different products provided by ESA (European Space Agency). It also describes altimeter data format stored on CD-Rom support. Additionally, the Analceos software package, written in the C language, is explained in detail; this latter was originally developed by M. Menez at IFREMER-CERSAT and permits the analysis of the CD-Rom logical structure where off-line LBR (low bit rate) products are stored in compliance with the CEOS (Committee on Earth Observation Satellites). The authors have solved the problem of porting the above program to the DEC Risc-Ultrix platform and have developed a C language module linked to Analceos that permits a user to select a working area through geographical coordinates (latitude, longitude). The output is a directory containing ASCII orbit files of tracks crossing the selected area. The report is mainly oriented towards specialists who want to analyse ESA products.

24982 (ESTSC–000805SPARC00) **SANDOSE. Sandia Total Dose Estimator Using Mass Sectoring of 3-D CAD Models.** Turner, C.D. (Sandia National Labs., Albuquerque, NM (United

States)); Ackermann, M. R. Sandia National Labs., Albuquerque, NM (United States). 1 Sep 1994. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: SUN SPARC; SunOS4.1x (UNIX); C, X-windows, SUN DevGuide (for graphical use interface); 1 3.5 Diskette. BRL-CAD is required to utilize SANDOSE, along with SUN DevGuide Software Libraries for the graphical user interface.

SANDOSE is an optional module for the Ballistic Research Laboratory CAD (BRL-CAD) package, Release 4.0 [1]. BRL-CAD is a moderately-advanced primitive-based, solid-modeling package which is available (including source code) from the Ballistic Research Laboratory. The purpose of SANDOSE is to estimate total radiation dose at specific locations in a BRL-CAD model. The radiation source is assumed to be omnidirectional. The code is integrated directly into the BRL-CAD solid model editor and is operated using a simple graphical user interface. Several diagnostic tools are available to allow the user to analyze the results, including graphical, color-coded intensity displays of sector rays. These displays are useful for qualitative analysis of shielding alternatives. Any model created using BRL-CAD can be analyzed with SANDOSE.

24983 (ESTSC–000895MLTPL00) **BLOCKSOLVE. Scalable Library for the Parallel Solution of Sparse Linear Systems.** Jones, M. (Argonne National Lab., IL (United States)); Plassmann, P. Argonne National Lab., IL (United States). 1 Mar 1993. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: MLT-PLTFM; Intel NX and Unix; it is largelyC; 1 3.5 Diskette.

BlockSolve is a scalable parallel software library for the solution of large sparse, symmetric systems of linear equations. It runs on a variety of parallel architectures and can easily be ported to others. BlockSovle is primarily intended for the solution of sparse linear systems that arise from physical problems having multiple degrees of freedom at each node point. For example, when the finite element method is used to solve practical problems in structural engineering, each node will typically have anywhere from 3-6 degrees of freedom associated with it. BlockSolve is written to take advantage of problems of this nature; however, it is still reasonably efficient for problems that have only one degree of freedom associated with each node, such as the three-dimensional Poisson problem. It does not require that the matrices have any particular structure other than being sparse and symmetric. BlockSolve is intended to be used within real application codes. It is designed to work best in the context of our experience which indicated that most application codes solve the same linear systems with several different right-hand sides and/or linear systems with the same structure, but different matrix values multiple times.

24984 (ESTSC–001048IBMPC00) **AF-500+DRIVER. Eaton AF5000+Genesis Communication Driver.** Eldridge, K. (CalMax, Inc, Spokane, WA (United States)). EG and G Energy Measurements, Inc., Los Alamos, NM (United States). Los Alamos Operations. 12 May 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-93NV11265. Source: ESTSC.

Description: IBM PC; Software driver compiled with MiMicrosoft C Compiler version 5.1 w/Iconics Driver Development Kit library header files.; 1 3.5 Diskette. To implement driver with Gensis software, a graphic configuration environment is used to select points for communications. Driver files must be copied into the directory where the Genesis system files reside.

Communication driver allows the Genesis Control Series software to interact with Eaton AF5000+ frequency drives via RS-232 communications. All Eaton AF5000+ parameters that support communications are supported by the Genesis driver. Multidrop addressing to multiple units is available with the Genesis communication driver.

24985 (ESTSC–001050SUN0000) **EDEN. Holographic Methods in X-ray Crystallography.** Szoke, A. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 1 Apr 1993. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: SUN; UNIX; FORTRAN; 1 Mag Tape.

The holographic method makes use of partially modeled electron density and experimentally-measured structure factor amplitudes to recover electron density corresponding to the unmodeled part of a crystal structure. This paper describes a fast algorithm that makes it possible to apply the holographic method to sizable crystallographic problems. The algorithm uses positivity constraints on the electron density, and can incorporate a target electron density, making it similar to solvent flattening. Using both synthetic and experimental data, we assess the potential for applying the holographic method to macromolecular x-ray crystallography.

24986 (FNAL–TM-1934) **Design notes for the next generation persistent object manager for CAP.** Isely, M. (and others); Fischler, M.; Galli, M. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95014550. Source: OSTI; NTIS; INIS; GPO Dep.

The CAP query system software at Fermilab has several major components, including SQS (for managing the query), the retrieval system (for fetching auxiliary data), and the query software itself. The central query software in particular is essentially a modified version of the 'ptool' product created at UIC (University of Illinois at Chicago) as part of the PASS project under Bob Grossman. The original UIC version was designed for use in a single-user non-distributed Unix environment. The Fermi modifications were an attempt to permit multi-user access to a data set distributed over a set of storage nodes. (The hardware is an IBM SP-x system - a cluster of AIX POWER2 nodes with an IBM-proprietary high speed switch interconnect). Since the implementation work of the Fermized ptool, the CAP members have learned quite a bit about the nature of queries and where the current performance bottlenecks exist. This has lead them to design a persistent object manager that will overcome these problems. For backwards compatibility with ptool, the ptool persistent object API will largely be retained, but the implementation will be entirely different.

24987 (INIS-mf–14544) **Transport process of digital simulation in hydraulic environmental engineering: direct and inverse problems analysis through an unidimensional model.** Suarez Antola, R. (Direccion Nacional de Tecnologia Nuclear, Montevideo (Uruguay)); Rodriguez Bojorja, F.; Lacues, E.; Alvarez, W. Ministerio de Industria, Energia y Mineria, Montevideo (Uruguay). Direccion Nacional de Tecnologia Nuclear; Universidad de la Republica, Montevideo (Uruguay). Facultad de Ingenieria. [1995]. 18p. (In Spanish). Order Number DE95632489. Source: OSTI; NTIS (US Sales Only); INIS.

Pre conference.

Mathematical model methods for impact evaluation environment were applied in the chemical effluent concentration time value.

24988 (INIS-mf–14546) **Digital simulation of an enrichment process for solutions by means of an advection-diffusion chamber.** Artucio, G. (Nuclear Technology National Direction (Uruguay)); Suarez, R. Ministerio de Industria, Energia y Mineria, Montevideo (Uruguay). Direccion Nacional de Tecnologia Nuclear; Universidad Catolica del Uruguay, Montevideo (Uruguay). [1995]. 13p. (In Spanish). Order Number DE95632490. Source: OSTI; NTIS (US Sales Only); INIS.

An ab-initio digital simulation of the space-time dynamics of the concentration field of a solute in an advection-diffusion chamber is done. Some questions related to the digital simulation of the concentration field using the analytical solution obtained in a previous paper are discussed.

24989 (INIS-mf–14547) **Sequential method for the assessment of innovations in computer assisted industrial processes.** Suarez Antola, R. (Universidad Catolica del Uruguay, Montevideo (Uruguay)); Artucio, G. Universidad Catolica del Uruguay, Montevideo (Uruguay); Ministerio de Industria, Energia y Mineria, Montevideo (Uruguay). Direccion Nacional de Tecnologia Nuclear. [1995]. 18p. (In Spanish). Order Number DE95632491. Source: OSTI; NTIS (US Sales Only); INIS.

A sequential method for the assessment of innovations in industrial processes is proposed, using suitable combinations of mathematical modelling and numerical simulation of dynamics. Some advantages and limitations of the proposed method are discussed. tabs.

24990 (JAERI-Data/Code–95-001) **MCVIEW2: a radiation view factor computer program for three dimensional geometries using Monte Carlo method.** Ikushima, Takeshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 68p. Order Number DE95789303. Source: OSTI; NTIS; INIS.

FORTRAN-77/FACOM M-780.

The computer program MCVIEW2, which is a revised version of MCVIEW, has been developed for calculation of radiation view factors between surfaces for three dimensional geometries. The main revisions of the computer program are as follows: (1) the alteration of algorithms of making the random numbers for the non-computer dependent, (2) the alteration of input data format from the free format to the fixed format. In the paper, brief illustration of calculation method using the Monte Carlo for view factors is presented in the second section. The third section presents comparisons between view factors of various methods such as the area integration method, the line integration method, the cross string method and the Monte Carlo method, concerning with the calculation errors and the computer execution time. The fourth section provides an user's guide for MCVIEW2. (author).

24991 (JAERI-Tech–95-014) **Development of animation processing system.** Kato, Katsumi (Nuclear Energy Data Center, Tokai, Ibaraki (Japan)); Watanabe, Tadashi; Machida, Masahiko; Kaburaki, Hideo. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 48p. (In Japanese). Order Number DE95789299. Source: OSTI; NTIS; INIS.

Computer and network environment for image processing has been developed and maintained by the computing and information systems center under the course of establishing a distributed processing environment. A server workstation was introduced for image processing. An animation processing system, in which simulation results are consecutively visualized on the server workstation and automatically recorded on a video tape, has been developed. In this report, a system construction, visualization in the workstation using a visualization tool, control of video tape recorder and workstation, and production of animation video are described with some examples. (author).

24992 (JINR-D–13-92-581, pp. 149-151) **Low-DAD3D integrated system for data acquisition and processing.** Nikiforov, A.S. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The LOW-DAD3D software for data acquisition and data processing from CAMAC modules is presented. It consists of program packages LOW and DAD3D. Both of them have easy-to-use environments for the user. The LOW package organizes data acquisition from CAMAC modules. Data read out by LOW are transferred to the DAD3D package for accumulation, data processing, analysis and presentation in the graphic form. This software allows one to decrease the time of testing CAMAC modules for high energy physical spectrometers. 1 ref.; 2 figs.

24993 (JINR-D–13-92-581, pp. 152-156) **Structure of software for automation system of spectrometric experiments by means of data bases.** Korneev, D.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Lyapin, D.I.; Ostrovnoj, A.I.; Salamatin, I.M.; Chelnokov, M.L.; Chernenko, L.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The data base is proposed as the central element for avoiding the gap between the acquisition and processing programs, combining the programs into unified complex. The structure of software for automation system of spectrometric experiments with application of the data base is considered by the example of the SPN program complex, developed at the LNF OIYal. The complex makes it possible to accomplish the data acquisition from detectors, their storage at the data base and preliminary processing and control over the spectrometer and CAMAC apparatus state in the course of the data acquisition. 3 refs.; 1 fig.

24994 (JINR-D–13-92-581, pp. 172-176) **Fastbus 64-digital input register with buffer memory.** Parfenov, A.N. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The FASTBUS-F6588 modulus constituting an input register with subsequent rerecording of the registered data into the buffer memory is developed for increasing the number of measuring channels. The modulus provides also for the possibility of assigning the time delay between the moment of the data recording start and the trigger signal. The input data recording and readout schemes are presented. 2 refs.; 2 figs.

24995 (JINR-D–13-92-581, pp. 260-272) **Generators for testing of spectrometric units performance.** Kuznetsov, A.N. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

Special generators for testing timing and amplitude characteristics of spectrometric units are described. The amplitude generator is accomplished in the CAMAC standard on the basis of the miniature KMP-M mercuric gercon with the shifting time of less than 500 μs. The possibility of the pulse amplitude programmed control is envisaged in the generator. Except analogous outlet the generator is provided for three timing outlets corresponding to the interval of linear gateways strobing. The basic characteristics of tested generators are presented. 6 refs.; 2 figs.

24996 (LA-SUB–95-77) **Using the force to write parallel HEP programs.** Jordan, H.F. Los Alamos National Lab., NM (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95014566. Source: OSTI; NTIS; GPO Dep.

The basic idea behind using the force method of parallel programming is to write a program (a force) which can be executed by any number of processes, including one process. The fork into parallel processes is done before the force is ever executed and the number of processes can be chosen on the basis of hardware efficiency only. Experience indicates that it is not hard to write programs which are independent of the number of executing processes on a shared-memory MIMD computer. Several such applications programs have been written for the HEP computer in HEP Fortran 77, which is standard Fortran 77 with very rudimentary parallel extensions. The constructs which seemed to be useful in these programs were formalized into a set of statements which can be macro-expanded into HEP Fortran 77. Some essential ideas to keep in mind when writing a force is that each statement is executed by all processes of the force unless an explicit synchronization prevents this. The distinction between a local variable, which has a separate memory cell assigned for each process referencing it, and a global variable, which has one memory cell which is used by all processes, is important to keep straight. There are force constructs which make it easy to specify that a section of code is to be executed by only one process. Other constructs specify that the body of a loop is to be executed for all values of the loop index in parallel with one process handling each index value. Unless explicit force statements prevent it, a call is executed by all processes so that subroutines executed by all processes of the force are also possible.

24997 (LA-UR–95-1169) **Parallel sphere rendering.** Krogh, M. (Los Alamos National Lab., NM (United States)); Hansen, C.;

Painter, J.; de Verdiere, G.C. Los Alamos National Lab., NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9510137–1: Parallel rendering symposium, Atlanta, GA (United States), 24 Oct 1995). Order Number DE95010882. Source: OSTI; NTIS; GPO Dep.

Sphere rendering is an important method for visualizing molecular dynamics data. This paper presents a parallel divide-and-conquer algorithm that is almost 90 times faster than current graphics workstations. To render extremely large data sets and large images, the algorithm uses the MIMD features of the supercomputers to divide up the data, render independent partial images, and then finally composite the multiple partial images using an optimal method. The algorithm and performance results are presented for the CM-5 and the T3D.

24998 (LA-UR–95-1223) **Interval neural networks.** Patil, R.B. Los Alamos National Lab., NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9503135–3: APIC '95, El Paso, TX (United States), Mar 1995). Order Number DE95012077. Source: OSTI; NTIS; GPO Dep.

Traditional neural networks like multi-layered perceptrons (MLP) use example patterns, i.e., pairs of real-valued observation vectors, $(\vec{x}, \vec{y})$, to approximate function $\hat{f}(\vec{x}) = \vec{y}$. To determine the parameters of the approximation, a special version of the gradient descent method called back-propagation is widely used. In many situations, observations of the input and output variables are not precise; instead, we usually have intervals of possible values. The imprecision could be due to the limited accuracy of the measuring instrument or could reflect genuine uncertainty in the observed variables. In such situation input and output data consist of mixed data types; intervals and precise numbers. Function approximation in interval domains is considered in this paper. We discuss a modification of the classical backpropagation learning algorithm to interval domains. Results are presented with simple examples demonstrating few properties of nonlinear interval mapping as noise resistance and finding set of solutions to the function approximation problem.

24999 (LBL–37206) **Impulse-based methods for fluid flow.** Cortez, R. Lawrence Berkeley Lab., CA (United States). May 1995. 105p. Sponsored by USDOE, Washington, DC (United States);California Univ., Berkeley, CA (United States);Department of Defense, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant FDF49620-93-1-0053. Order Number DE95014792. Source: OSTI; NTIS; GPO Dep.

A Lagrangian numerical method based on impulse variables is analyzed. A relation between impulse vectors and vortex dipoles with a prescribed dipole moment is presented. This relation is used to adapt the high-accuracy cutoff functions of vortex methods for use in impulse-based methods. A source of error in the long-time implementation of the impulse method is explained and two techniques for avoiding this error are presented. An application of impulse methods to the motion of a fluid surrounded by an elastic membrane is presented.

25000 (ORNL/M–4316) **Additional verification problems for HEATING 7.2.** Park, J.E. Oak Ridge National Lab., TN (United States). Jun 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013791. Source: OSTI; NTIS; GPO Dep.

First estimates of heat transfer coefficients from the quenches at Torrington and IITRI were presented on December 1, 1994, at NCMS. Some of the calculated values were negative. Several suggestions have been made as to the cause of this clearly physically unrealistic result. In this first portion of a systematic investigation of the problem, the thermal analysis code HEATING 7.2 is used to solve two possibly relevant demonstration problems.

25001 (ORNL/TM–12988) **A note on seven analogous properties between Stirling numbers of the first kind and binomial coefficients.** Wright, T. Oak Ridge National Lab., TN (United States). Jun 1995. 11p. Sponsored by National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014464. Source: OSTI; NTIS; GPO Dep.

This brief report gives seven analogous properties between Stirling numbers of the first kind and binomial coefficients.

25002 (PNL-SA–23600) **TEMPEST: A computer code for three-dimensional analysis of transient fluid dynamics.** Fort, J.A. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015802. Source: OSTI; NTIS; INIS; GPO Dep.

TEMPEST (Transient Energy Momentum and Pressure Equations Solutions in Three dimensions) is a powerful tool for solving engineering problems in nuclear energy, waste processing, chemical processing, and environmental restoration because it analyzes and illustrates 3-D time-dependent computational fluid dynamics and heat transfer analysis. It is a family of codes with two primary versions, a N- Version (available to public) and a T-Version (not currently available to public). This handout discusses its capabilities, applications, numerical algorithms, development status, and availability and assistance.

25003 (PNL-SA–24715) **Global arrays: A portable "shared-memory" programming model for distributed memory computers.** Harrison, R.J.; Nieplocha, J.; Littlefield, R.J. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941118–11: Supercomputing '94 meeting, Washington, DC (United States), 14-18 Nov 1994). Order Number DE95014622. Source: OSTI; NTIS; GPO Dep.

Portability, efficiency, and ease of coding are all important considerations in choosing the programming model for a scalable parallel application. The message-passing programming model is widely used because of its portability, yet some applications are too complex to code in it while also trying to maintain a balanced computation load and avoid redundant computations. The shared-memory programming model simplifies coding, but it is not portable and often provides little control over interprocessor data transfer costs. This paper describes a new approach, called Global Arrays (GA), that combines the better features of both other models, leading to both simple coding and efficient execution. The key concept of GA is that it provides a portable interface through which each process in a MIMD parallel program can asynchronously access logical blocks of physically distributed matrices, with no need for explicit cooperation by other processes. The authors have implemented GA libraries on a variety of computer systems, including the Intel DELTA and Paragon, the IBM SP-1 (all message-passers), the Kendall Square KSR-2 (a nonuniform access shared-memory machine), and networks of Unix workstations. They discuss the design and implementation of these libraries, report their performance, illustrate the use of GA in the context of computational chemistry applications, and describe the use of a GA performance visualization tool.

25004 (PNL-SA–24972) **A tool for promoting pollution prevention in facility design.** Greitzer, F.L. (and others); Brown, B.W.; Dorsey, J.A. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950451–5: 21. national environmental symposium and exhibition, San Diego, CA (United States), 17-21 Apr 1995). Order Number DE95014173. Source: OSTI; NTIS; GPO Dep.

The Pacific Northwest Laboratory[a] has developed a tool to assist in incorporating pollution prevention opportunities into the design of federal facilities. The pollution prevention electronic design guideline (EDG), developed for the U.S. Department of Energy (DOE), contains a database of 267 opportunities intended to help a decisionmaker (designer, engineer, or project manager) evaluate the applicability and potential benefits of implementing pollution prevention in a particular project. The EDG's database was derived from both DOE and non-DOE sources including pollution prevention literature, industrial design personnel, and federal, state, and DOE sources. A key feature of the tool is the integration of photos, illustrations, and documentation to provide easy access to technical information on specific waste minimization opportunities in design. This paper describes the software tool, the Pollution Prevention Electronic Design Guideline (EDG). The EDG runs on a personal computer within the Microsoft Windows environment. The EDG is

used with the P2DA Guidance Manual on a project-by-project basis. The P2DA process is analogous to the Waste Minimization Assessment method established by the U.S. Environmental Protection Agency for existing process waste streams. The EDG is introduced during the stage of the P2DA when design alternatives are being explored (after the anticipated waste streams have been quantified). As such, the EDG database is not exhaustive, and it is not computational (i.e., it does not compute the lifecycle impacts of implementation). Its purpose is to raise awareness of existing technologies and design practices that can improve resource efficiency or decrease waste generation over the entire life of the project (construction, operation, and decommissioning), and to provide a template for the documentation. Because design is an iterative process, the EDG is also intended to be revisited with each successive design stage.

25005 (PNL-SA–25715) **A programmable Fortran preprocessor.** Rosing, M. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9506208–1: ACM sigplan conference on programming language design and implementation, La Jolla, CA (United States), 18-21 Jun 1995). Order Number DE95014196. Source: OSTI; NTIS; GPO Dep.

A programmable Fortran preprocessor is described. It allows users to define compile time operations that can examine and modify the source tree before it is compiled with a traditional compiler. This intermediate step allows the definition of routines and operations that adapt to the context in which they are used. Context sensitive operations increase the flexibility of abstractions that can be built without degrading efficiency, as compared to using traditional run time based abstractions such as libraries or objects. The preprocessor is described briefly along with an example of how it is used to add CMFortran array operations to Fortran77. Other preprocessors that have been implemented are also briefly described.

25006 (PNL-SA–26072) **Human-computer interface design.** Bowser, S.E. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9504185–1: Software technology conference, Salt Lake City, UT (United States), 9-14 Apr 1995). Order Number DE95014607. Source: OSTI; NTIS; GPO Dep.

Modern military forces assume that computer-based information is reliable, timely, available, usable, and shared. The importance of computer-based information is based on the assumption that "shared situation awareness, coupled with the ability to conduct continuous operations, will allow information age armies to observe, decide, and act faster, more correctly and more precisely than their enemies." (Sullivan and Dubik 1994). Human-Computer Interface (HCI) design standardization is critical to the realization of the previously stated assumptions. Given that a key factor of a high-performance, high-reliability system is an easy-to-use, effective design of the interface between the hardware, software, and the user, it follows logically that the interface between the computer and the military user is critical to the success of the information-age military. The proliferation of computer technology has resulted in the development of an extensive variety of computer-based systems and the implementation of varying HCI styles on these systems. To accommodate the continued growth in computer-based systems, minimize HCI diversity, and improve system performance and reliability, the U.S. Department of Defense (DoD) is continuing to adopt interface standards for developing computer-based systems.

25007 (PNL-SA–26086) **Use of GIS in the Federal Emergency Management Information System (FEMIS).** Tzemos, S.; Burnett, R.A. Pacific Northwest Lab., Richland, WA (United States). May 1995. 25p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505242–1: 1995 ESRI user conference, Palm Springs, CA (United States), 22-26 May 1995). Order Number DE95014613. Source: OSTI; NTIS; GPO Dep.

The Federal Emergency Management Information System (FEMIS) is a decision support system that integrates all phases of emergency management. FEMIS is designed to support the emergency manager in planning, coordination, response, training and exercise. FEMIS uses a classic client-server architecture. The FEMIS component modules include a Human-Computer Interface (HCI), a relational database management system (RDBMS), an electronic mail system, a report generator, a project management system, a geographic information system (GIS), and hazard specific modeling and analysis tools. Of these systems, the RDBMS and the evacuation model reside on a UNIX platform while all the other software reside on networked personal computer (PC) workstations. ArcView 2.0 is the GIS product used to support FEMIS at each PC workstation. ARC/INFO is loaded on the UNIX-based server and is used to prepare the spatial data. This paper describes the way GIS support for FEMIS was built using Avenue scripts and the inter-process communications available through ArcView 2.0. It also identifies the limitations encountered and the way the HCI was built to overcome them. The final product is a fully integrated responsive, user-oriented decision support system, capable of linking the planning, response, recovery, and mitigation phases of emergency management.

25008 (SAND–94-3124) **Assembly sequencing with toleranced parts.** Latombe, J.C. (Stanford Univ., CA (United States). Robotics Lab.); Wilson, R.H. Sandia National Labs., Albuquerque, NM (United States). 21 Feb 1995. 30p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Department of Defense, Washington, DC (United States);Stanford Integrated Mfg. Association (United States). DOE Contract AC04-94AL85000. Order Number DE95011832. Source: OSTI; NTIS; GPO Dep.

The goal of assembly sequencing is to plan a feasible series of operations to construct a product from its individual parts. Previous research has thoroughly investigated assembly sequencing under the assumption that parts have nominal geometry. This paper considers the case where parts have toleranced geometry. Its main contribution is an efficient procedure that decides if a product admits an assembly sequence with infinite translations that is feasible for all possible instances of the components within the specified tolerances. If the product admits one such sequence, the procedure can also generate it. For the cases where there exists no such assembly sequence, another procedure is proposed which generates assembly sequences that are feasible only for some values of the toleranced dimensions. If this procedure produces no such sequence, then no instance of the product is assemblable. Finally, this paper analyzes the relation between assembly and disassembly sequences in the presence of toleranced parts. This work assumes a simple, but non-trivial tolerance language that falls short of capturing all imperfections of a manufacturing process. Hence, it is only one step toward assembly sequencing with toleranced parts.

25009 (SLAC-R–95-464) **Proceedings of the REXX symposium for developers and users.** Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 373p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9505198–: REXX symposium for developers and users, Stanford, CA (United States), 1-3 May 1995). Order Number DE95016261. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains viewgraphs on the following topics: REXX 1995 – the growth of a language; the future of REXX; problems and issues writing REXX compliers; writing CGI scripts for WWW using REXX; object REXX: up close and personal; object REXX: openDoc support; report from the X3J18 committee; Centerpiece and object oriented REXX; REXX, distributed systems and objects; getting ready for object REXX; SOM – present and future; rexinda; REXX for CICS/ESA; REXX changes in OS/2 warp; S/REXX by Benaroya; a REXX-based stock exchange real-time client/server environment for research, educational and public relations purposes: implementation and usage issues; REXX/370 Compiler and Library 1995; and how REXX helped me hit the ground running in UNIX.

25010 (SREL–50) **UnCensor© v4.0.** Newman, M.C.; Greene, K.D.; Dixon, P.M. Savannah River Ecology Lab., Aiken, SC (United States). 1995. 92p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract AC09-76SR00819. Order Number DE95015347. Source: OSTI; NTIS; GPO Dep.

UnCensor© is a program that estimates the mean, standard deviation, variance, and the confidence interval on the mean of left censored data sets. At present, the program can provide estimates for normal and two-parameter lognormal data sets. Large ($N > 20$) and small ($N \leq 20$) data sets can be handled. UnCensor© provides estimates by the application of several statistical methods. At present, these methods include the following. The explanations are taken from the appendix of the companion paper for this program (Newman et al. 1989 and Newman 1995.)

25011 (UCRL-CR–120462) **Involving users in the design cycle for parallel tools second period September 1, 1994–January 31, 1995.** Pancake, C.M. (Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science). Lawrence Livermore National Lab., CA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science. 31 Jan 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013275. Source: OSTI; NTIS; GPO Dep.

Parallel programmers do not use software tools, in spite fact that parallel development is a difficult and time-consuming task that could benefit from tool support. It has become increasingly clear that the simple availability of elegant, powerful software tools employing the latest technology is not enough. Usability is the real key to success; users simply do not adopt tools that fail to respond to their needs. Research in the area of usability engineering indicates that five design principles can have significant impact on parallel tool usability: tools must be based on demonstrable user requirements; actively involve users throughout tool design; minimize tool complexity to reduce the learning curve support the tool across multiple machine platforms to amortize the user's investment employ iterative refinement techniques to improve tool usability. Those principles served as the starting point for a Parallel Tools Consortium project to develop a tool that will help users determine the final state of a program that crashes or is terminated forcibly. Carried out over a period of ten months, the project involved the collaboration of tool researchers, and implementors, and users. This report describes how user-centered design techniques were applied to ensure that the tool would provide simple, intuitive support for the programmer's task. Users were recruited for the project working group so that they could have direct input to design decisions, even in the earliest sets of user trials. Additional feedback was acquired from a broader user base, in three distinct phases. These were spaced out over a period of six months so that feedback could be analyzed, then applied to refine the tool before the next trial. In some cases, user input kept us from investing substantial effort in features that would not have been used or appreciated. In others, feedback showed us where our conceptions of usefulness did not quite align with those of the user community.

25012 (UCRL-ID–119734) **LLNL state-of-the-art codes for source calculations.** Glenn, L.A. Lawrence Livermore National Lab., CA (United States). Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014673. Source: OSTI; NTIS; GPO Dep.

The explosion-source region is defined as the region surrounding an underground explosion that cannot be described by elastic or anelastic theory. This region extends typically to ranges on the order of 1 km/kt. For the simulation or analysis of seismic signals, what is required is the time resolved motion and stress state at the inelastic boundary. Various analytic approximations have been made for these boundary conditions, but since they rely on near-field empirical data they cannot be expected to reliably extrapolate to different explosion sites. More important, without some knowledge of the initial energy density and the characteristics of the medium immediately surrounding the explosion, these simplified models are unable to distinguish chemical from nuclear explosions, identify cavity decoupling, or account for such phenomena as anomalous dissipation via pore collapse. The purpose here is to document the state-of-the-art codes at LLNL involved in simulating underground (chemical and nuclear) explosions and, in so doing, present an overview of the physics. In what follows, the authors first describe the fundamental equations involved, discuss solution methods, coordinate frames and dimensionality. Then they identify the codes used at LLNL and their limitations. A companion report will describe the factors that most influence the seismic response, i.e., the source properties important for discrimination. That report will emphasize the coupling between the rock properties and the characteristics of the explosion cavity.

25013 (UCRL-ID–120484) **Smile (System/Machine-Independent Local Environment).** Fletcher, J.G. Lawrence Livermore National Lab., CA (United States). Apr 1988. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015129. Source: OSTI; NTIS; GPO Dep.

This document defines the characteristics of Smile, a System/machine-independent local environment. This environment consists primarily of a number of primitives (types, macros, procedure calls, and variables) that a program may use; these primitives provide facilities, such as memory allocation, timing, tasking and synchronization beyond those typically provided by a programming language. The intent is that a program will be portable from system to system and from machine to machine if it relies only on the portable aspects of its programming language and on the Smile primitives. For this to be so, Smile itself must be implemented on each system and machine, most likely using non-portable constructions; that is, while the environment provided by Smile is intended to be portable, the implementation of Smile is not necessarily so. In order to make the implementation of Smile as easy as possible and thereby expedite the porting of programs to a new system or a new machine, Smile has been defined to provide a minimal portable environment; that is, simple primitives are defined, out of which more complex facilities may be constructed using portable procedures. The implementation of Smile can be as any of the following: the underlying software environment for the operating system of an otherwise "bare" machine, a "guest" system environment built upon a preexisting operating system, an environment within a "user" process run by an operating system, or a single environment for an entire machine, encompassing both system and "user" processes. In the first three of these cases the tasks provided by Smile are "lightweight processes" multiplexed within preexisting processes or the system, while in the last case they also include the system processes themselves.

25014 (UCRL-ID–120485) **APST Interfaces in LINCS.** Fletcher, J.G. Lawrence Livermore National Lab., CA (United States). Jul 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015105. Source: OSTI; NTIS; GPO Dep.

APST is an acronym for the four highest of the seven layers of the LINCS hierarchy of communication protocols: (from high to low) Application, Presentation, Session, and Transport. Routines in each but the lowest of these APST layers can utilize the facilities of any lower APST layer (normally, but not necessarily, the immediately next lower layer) by invoking various primitives (macros that in most cases are subroutine calls) defining the upper interface of the lower layer. So there are three APST interfaces: Presentation layer, used by the Application layer; Session layer, normally used by the Presentation layer; and Transport layer, normally used by the Session layer. Logically, each end of a stream (unidirectional sequence of transmitted information) is handled by three modules, one module each for the Presentation, Session, and Transport layers, and each of these modules deals with only that one end of that one stream. The internal workings of the layers, particularly the Transport layer, do not necessarily exhibit this same modularization; for example, the two oppositely directed streams between the same two ends (constituting an association) may interact within a layer. However, such interaction is an implementational detail of no direct interest to those utilizing the layer. The present document does not describe implementation, nor does it discuss in any detail how the modules employ packet headings and data formats to communicate with their partner modules at the other end of a stream. There being one logical module per end of stream is a characteristic only of the Presentation, Session, and Transport layers. An Application layer module usually manages several streams, orchestrating them to achieve some desired purpose. The modules of the layers (Network, Link, and Physical) below the APST layers

each handle many streams, multiplexing them through the nodes and channels of the network to transmit them from their origins to their destinations.

25015 (UCRL-JC–119772) **The parallel I/O architecture of the High Performance Storage System (HPSS).** Watson, R.W. (Lawrence Livermore National Lab., CA (United States)); Coyne, R.A. Lawrence Livermore National Lab., CA (United States). Feb 1995. 40p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950985–1: 14. Institute of Electrical and Electronics Engineers (IEEE) symposium on mass storage systems, Monterey, CA (United States), 11-14 Sep 1995). Order Number DE95007126. Source: OSTI; NTIS; GPO Dep.

Rapid improvements in computational science, processing capability, main memory sizes, data collection devices, multimedia capabilities and integration of enterprise data are producing very large datasets (10s-100s of gigabytes to terabytes). This rapid growth of data has resulted in a serious imbalance in I/O and storage system performance and functionality. One promising approach to restoring balanced I/O and storage system performance is use of parallel data transfer techniques for client access to storage, device-to-device transfers, and remote file transfers. This paper describes the parallel I/O architecture and mechanisms, Parallel Transport Protocol, parallel FIP, and parallel client Application Programming Interface (API) used by the High Performance Storage System (HPSS). Parallel storage integration issues with a local parallel file system are also discussed.

25016 (UCRL-JC–120527) **Visualization of transient finite element analyses on large unstructured grids.** Dovey, D. Lawrence Livermore National Lab., CA (United States). 22 Mar 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9510141–1: Institute for Electrical and Electronics Engineers visualization '95, Atlanta, GA (United States), 30 Oct - 3 nov 1995). Order Number DE95011529. Source: OSTI; NTIS; GPO Dep.

Three-dimensional transient finite element analysis is performed on unstructured grids. A trend toward running larger analysis problems, combined with a desire for interactive animation of analysis results, demands efficient visualization techniques. This paper discusses a set of data structures and algorithms for visualizing transient analysis results on unstructured grids and introduces some modifications in order to better support large grids. In particular, an element grouping approach is used to reduce the amount of memory needed for external surface determination and to speed up "point in element" tests. The techniques described lend themselves to visualization of analyses carried out in parallel on a massively parallel computer (MPC).

25017 (UCRL-JC–120528) **Vector carpets.** Dovey, D. Lawrence Livermore National Lab., CA (United States). 22 Mar 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9510141–2: Institute for Electrical and Electronics Engineers visualization '95, Atlanta, GA (United States), 30 Oct - 3 nov 1995). Order Number DE95011530. Source: OSTI; NTIS; GPO Dep.

Previous papers have described a general method for visualizing vector fields that involves drawing many small "glyphs" to represent the field. This paper shows how to improve the speed of the algorithm by utilizing hardware support for line drawing and extends the technique from regular to unstructured grids. The new approach can be used to visualize vector fields at arbitrary surfaces within regular and unstructured grids. Applications of the algorithm include interactive visualization of transient electromagnetic fields and visualization of velocity fields in fluid flow problems.

25018 (UCRL-LR–119748) **Large-eddy simulation of the Rayleigh-Taylor instability on a massively parallel computer.** Amala, P.A.K. (California Univ., Davis, CA (United States). Dept. of Applied Science). Lawrence Livermore National Lab., CA (United States); California Univ., Davis, CA (United States). Dept. of Applied Science. Mar 1995. 135p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014132. Source: OSTI; NTIS; GPO Dep.

A computational model for the solution of the three-dimensional Navier-Stokes equations is developed. This model includes a turbulence model: a modified Smagorinsky eddy-viscosity with a stochastic backscatter extension. The resultant equations are solved using finite difference techniques: the second-order explicit Lax-Wendroff schemes. This computational model is implemented on a massively parallel computer. Programming models on massively parallel computers are next studied. It is desired to determine the best programming model for the developed computational model. To this end, three different codes are tested on a current massively parallel computer: the CM-5 at Los Alamos. Each code uses a different programming model: one is a data parallel code; the other two are message passing codes. Timing studies are done to determine which method is the fastest. The data parallel approach turns out to be the fastest method on the CM-5 by at least an order of magnitude. The resultant code is then used to study a current problem of interest to the computational fluid dynamics community. This is the Rayleigh-Taylor instability. The Lax-Wendroff methods handle shocks and sharp interfaces poorly. To this end, the Rayleigh-Taylor linear analysis is modified to include a smoothed interface. The linear growth rate problem is then investigated. Finally, the problem of the randomly perturbed interface is examined. Stochastic backscatter breaks the symmetry of the stationary unstable interface and generates a mixing layer growing at the experimentally observed rate. 115 refs., 51 figs., 19 tabs.

25019 (WHC-SD-GN-UM–30005-Rev.1) **AutoCAD discipline layering convention. Revision 1.** Nielsen, B.L. Westinghouse Hanford Co., Richland, WA (United States). 17 May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013348. Source: OSTI; NTIS; GPO Dep.

This document is a user's guide to establishing layering standards for drawing development. Uniform layering standards are established to exchange of AutoCAD datasets between organizations and companies. Consistency in the layering conventions assists the user through logical separation and identification of drawing data. This allows the user to view and plot related aspects of a drawing separately or in combination. The use of color and Linetype by layer is the preferred layering convention method, however to accommodate specific needs, colors and linetypes can also be assigned on an entity basis. New drawing setup files (also identified in AutoCAD documentation as Prototype drawings) use this layering convention to establish discipline drawing layers that are routinely used. Additions, deletions or revisions to the layering conventions are encourage.

25020 (ANL/DIS/CP–86615) **Buffer reduction in an attribute-based concurrent transaction processing system.** Henschen, L.J. (Northwestern Univ., Evanston, IL (United States). Dept. of Electrical Engineering and Computer Science); Lee, J.C. Argonne National Lab., IL (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9507135–1: 7. international conference on computing and information, Ontario (Canada), 5-8 Jul 1995). Order Number DE95014224. Source: OSTI; NTIS; GPO Dep.

The authors presented a way to improve the buffer usage for the transaction management model in an earlier study. The method presented in this paper identifies the conflicting and the non-conflicting parts of the affected data sets and separates them. The original operations are converted into two sets of operations–one set operates on disjoint data and can be executed in parallel, another set operates on conflicting data using buffers. This approach will reduce the size of the buffers used in the earlier approach.

25021 (ANL/OTD-PR/CP–86451) **Chemical management system at Argonne National Laboratory.** Morss, H.S. (Argonne

National Lab., IL (United States)); Hischier, R.C.; Keto, D.N.; Woodring, J.L.; Davis, J.T.; Sherva, B. Argonne National Lab., IL (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505234–1: 2. international symposium on computerized chemical data standards: databases, data interchange, and information systems, Columbus, OH (United States), 10-12 May 1995). Order Number DE95013695. Source: OSTI; NTIS; GPO Dep.

The Argonne Chemical Management System (CMS) is comprised of several applications and the Infrastructure Modules. The Infrastructure Modules, which provide the integrated computing software foundation, include a security processor, common tables, reporting framework, utilities, and other facilities common to applications processing chemical information. The MSDS Sheets were scanned and the images stored for automated faxing to the requester. User searches are accomplished based on "search" data keyed into the Oracle Tables; the desired MSDS is subsequently faxed. The system has been designed as an "open" system and is totally portable. During development and production the CMS has operated in VAX, VMS, Sun Unix, and Hewlett-Packard HP-UX environments. The only restrictions are that the MSDS Faxing Server must operate under Unix and the bar code scanning processes are accomplished using a portable PC. The current system consists of 20 Oracle Tables, over 350 columns of data, 25 Standard reports, 45 screens, and a number of utilities. With the Oracle RDBMS the computing platform may be sized to the volume of data and processing activity. The Laboratory's implementation is on an HP 9000 Model H50 with 256 megabytes of memory, 32 concurrent users, and 8 gigabytes of disk storage that is primarily for the MSDS images.

25022 (BNWL-D–260) **Letter to D. R. Harbur.** King, R.R. Battelle-Northwest, Richland, WA (United States). Pacific Northwest Lab. 18 Nov 1976. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012661. Source: OSTI; NTIS; GPO Dep.

Short communication. HANFORD RESERVATION/classified information; SECURITY; ADMINISTRATIVE PROCEDURES

25023 (CRIE-R–93016) **CRIEPI-FPA, a software sizing technique.** Takahashi, M. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Hishitani, J. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Mar 1994. 28p. (In Japanese). Order Number DE95790578. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

A technique was developed in which the function point (FP) of software was calculated from required specifications and a sizing estimation was performed for the development of business application software. The functions of this technique were classified into 8 kinds consisting of a menu screen, input file, input screen, input/output file, input/output screen, output file, output screen and business form. Discrimination on the degree of difficulty was made on a subjective three phase evaluation from two viewpoints, the 'number of items' and the 'complexity of processing'. The estimation procedure was such that, first, the number of kinds was counted for functional parts along the classification, a weighted summary was made with the FP reference value, and the FP was calculated. The result was then substituted in the estimation formula for the sizing estimation and, the sizing for the development was obtained. The FP reference value and the coefficient of the estimation formula were decided based on the actual development data in the past. This technique was experimentally applied to the software development projects of 40 software developers. As a result, the estimation of source lines was in the range of less than $\pm 30\%$ of the actual value on 60% or more projects. 22 refs., 8 figs., 4 tabs.

25024 (DOE/EIA–0569(95/1Q)) **EIA directory of electronic products, first quarter 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of the National Energy Information System. Jun 1995. 77p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014357. Source: OSTI; NTIS; GPO Dep.

The Energy Information Administration (EIA) makes available for public use a series of machine-readable data files and computer models. The data files and models are made available to the public on magnetic tapes. In addition, selected data files/models are available on diskette for IBM-compatible personal computers. EIA, as the independent statistical and analytical branch of the Department of Energy, provides assistance to the general public through the National Energy Information Center (NEIC). For each product listed in this directory, a detailed abstract is provided which describes the data published. Specific technical questions may be referred to the appropriate contact person.

25025 (JINR-D–13-92-581, pp. 6-21) **Present-day state of automatization of scientific researches in academic institutes.** Gulyaev, Yu.V.; Zhuravlev, E.E.; Olejnikov, A.Ya. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The state of works on technology relative to creation and development of technical and programming means for scientific research computerized systems based on international standards, networks and interfaces is presented. The review is based on the analysis of periodical publications, conference and symposia materials, as well as materials specially presented to the Council on automation. An attempt is made to forecast the basic trends. 16 refs.; 19 figs.

25026 (JINR-D–13-92-581, pp. 22-31) **Open buses in physical research.** Kolpakov, I.F. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). New generation of open buses VME64, VSB, Futurebus, SCI and FDDI, which make it possible to process large-volume data flows by experiments on supercolliders, is described. The data on the throughput capacity of these standard buses. High-efficiency systems for data acquisition and processing may be created through their application. Problems on search of new architectural decisions using the VME64, VXI, Futurebus and SCI standards may be considered. 10 refs.; 2 figs.

25027 (JINR-D–13-92-581, pp. 32-43) **Radial and ring two-point structures for data collection and processing.** Vinogradov, V.I. (RAN, Inst. Yadernykh Issledovanij, Moscow (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

Comparative analysis of two-point communication structures of radial and ring topology is carried out. Development of ring structures with application of various transmission types (parallel, consecutive) and common communication medium is shown. Versions of perspective ring structures for subsystems of operational memory and distributive input-output are considered. The two-point communication structures may be applied for construction of various communication modular systems, accomplished in the CAMAC and VME standards. 12 refs.

25028 (JINR-D–13-92-581, pp. 136-142) **Autonomous system for digital signal processing.** Ganbat, G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Glejbman, Eh.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

Autonomous system for digital signal processing is developed. The system is applied for measuring parameters of the betatron beam oscillations at the U-70 accelerator (IFVE, Protvino). The system is based on the kreit microcomputer and two units of fast processor accomplished on the basis of the TMS 32010 type DSP.

The fast processor unit operates as the SLAVE in the microprocessor system MIK, wherein the CAMAC/MULTIBUS combined protocol is realized with the purpose of organizing multiprocessor operation. 5 refs.; 3 figs.

25029 (PNL-SA–23964) **Quest for quality informal proceedings of the first Hanford Site Technical Communications Seminar.** Allen, R.E. Pacific Northwest Lab., Richland, WA (United States). Nov 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9311311–Summ.: Quest for quality communications seminar, Richland, WA (United States), 17 Nov 1993). Order Number DE95011497. Source: OSTI; NTIS; GPO Dep.

Eighty-eight people from five Hanford contractors gathered November 17, 1993, at Pacific Northwest Laboratory (PNL) to embark on a quest for quality in Technical Communications. PNL's Applied Technologies Communication (ATC) section of the Technical Information and Communications Department (TI&CD) hosted the half-day Quest for Quality seminar, which covered such topics as document design, site-wide production standards, and "reinventing government." The seminar was the first of its kind to include technical communications professionals from all Hanford Site contractors; attendees included technical editors and writers, publications assistants, text processors, and document production staff. A complete list of the attendees is included as Appendix A and the presenters are listed in Appendix B. Five Hanford contractors have technical communications staffs, all trying to meet the needs of one primary customer: the US Department of Energy (DOE). Historically, these contractors have maintained different processes and standards with regard to document production, and little interaction or information sharing has occurred. To begin remedying that situation, PNL invited technical communicators across the Hanford Site to attend the first Quest for Quality Technical Communications Seminar. The purpose of the seminar was to identify ways to improve the quality of Hanford's communication products and processes and to strengthen ties among technical communications staffs at the site. We hoped to open the lines of communication for future collaborative efforts.

25030 (SAND–95-0226C) **User-driven product data manager system design.** Sandia National Labs., Albuquerque, NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951092–2: Human Factors and Ergonomics Society meeting, San Diego, CA (United States), 9-13 Oct 1995). Order Number DE95007739. Source: OSTI; NTIS; GPO Dep.

With the infusion of information technologies into product development and production processes, effective management of product data is becoming essential to modern production enterprises. When an enterprise-wide Product Data Manager (PDM) is implemented, PDM designers must satisfy the requirements of individual users with different job functions and requirements, as well as the requirements of the enterprise as a whole. Concern must also be shown for the interrelationships between information, methods for retrieving archival information and integration of the PDM into the product development process. This paper describes a user-driven approach applied to PDM design for an agile manufacturing pilot project at Sandia National Laboratories that has been successful in achieving a much faster design-to-production process for a precision electro mechanical surety device.

25031 (SAND–95-0336C) **On-line controlled documents: Lessons learned.** Cochrell, R.C.; Steele, C.M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950876–1: 19. annual symposium of the Nuclear Information Records Management Association, Washington, DC (United States), 27-30 Aug 1995). Order Number DE95013555. Source: OSTI; NTIS; GPO Dep.

Placing Controlled Documents on-line on a computer network seems like the solution to many problems, one being distribution, with a path toward a paperless office. However, many problems presented themselves as we were designing the system and placing the documents on-line. Although we planned and established a Process Management Team to help work out the bugs, we still encountered many obstacles in the process. This presentation will cover the "trials and tribulations" of placing Controlled Documents on a computer network at three different sites. We will discuss the process we went through, the problems we encountered, the software we used, and how we got management to buy into the process.

25032 (SAND–95-1065) **Sandia National Laboratories (SNL) and Oak Ridge National Laboratories (ORNL) joint development of SNL's sample tracking, analysis and reporting (STAR) information system.** Fish, J. (and others); Campbell, D.; Jenkins, B. Sandia National Labs., Albuquerque, NM (United States). May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014492. Source: OSTI; NTIS; GPO Dep.

A comprehensive environmental sample management program allocates much of its resources to collecting, managing, and manipulating information. A computerized system that collects information at the field sampling point, tracks the sample to analytical labs and loads electronic data deliverables from these labs, while maintaining chain of custody and data integrity, is efficient and cost effective for providing consistent and accurate, legally defensible sample data. In June 1993, a team was formed to gather Sample Management Office requirements and begin development of a sample tracking system. This paper is an overview of experiences encountered when Sandia transferred and implemented sample software from the Waste Area Group (WAG6) at ORNL.

25033 (SAND–95-1168C) **A systems configuration toolkit for modular integration of mechatronic resources.** Oppel, F.J. III; Palmquist, R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506178–3: International Association of Science and Technology for Development conference on robotics and manufacturing, Cancun (Mexico), 14-17 Jun 1995). Order Number DE95013863. Source: OSTI; NTIS; GPO Dep.

The use of the NII (National Information Infrastructure) is growing rapidly in the number of users and in the areas in which it is being applied. Sandia is using, the NII to leverage the use of geographically distributed mechatronic (electromechanical) assets. This paper discusses the availability of networks, new challenges for robotics technology, and how the use of networks is helping to meet these challenges. A brief overview of the NII is provided, followed by a listing of "needs" within the intelligent systems community. An approach is then given for meeting, these needs and, finally, implementation, examples, and future research directions are discussed.

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in ETDE/PUB–3 (Rev.1), *International Energy: Research Organizations 1988–1992*. Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, indicated by International Organization for Standardization (ISO) country code; and (3) the language of the document if non-English (R;CA;In French). Author affiliations are not listed in this index.

Surveillance of Site A and Plot M report for 1994, 20:23159 (R;US)
Survey and alignment report on the primary control network for the APS, 20:24334 (R;US)
Tagential winding coil probes for dipole, quadrupole and sextupole magnet measurements, 20:24252 (R;US)
Technical basis for chemical stockpile emergency planning, 20:24441 (R;US)
Technical specification for plate fabrication for the ATLAS Tile Hadron Calorimeter, 20:24343 (R;US)
Tests on conducted electrical noise on a storage ring dc-dc converter cabinet, 20:24273 (R;US)
The APS direct-drive pulsed septum magnets, 20:24162 (R;US)
The corrosion behavior of DWPF glasses, 20:23900 (R;US)
The effect of incident angle on the shielding thickness for secondary bremsstrahlung, 20:24277 (R;US)
The vacuum system for insertion devices at the Advanced Photon Source, 20:24177 (R;US)
Thermal and mechanical measurements of the prototype SR quadrupole, 20:24332 (R;US)
Thermal characteristics of a low-loss liquid-helium dewar, 20:24757 (R;US)
Thermo-mechanical optimization of Fixed Mask 2 for APS front ends, 20:24265 (R;US)
Thermo-mechanical optimization of photon shutter 1 for APS front ends, 20:24266 (R;US)
Thermo-mechanical parametric studies of Fixed Mask 1 and Photon Shutter 2 for APS front ends, 20:24268 (R;US)
Transverse emittance systematics measured for heavy-ion beams at ATLAS, 20:24106 (R;US)
Transverse instability analysis for the IPNS Upgrade, 20:24102 (R;US)
Travel to Steel Warehouse Inc., Southbend, Indiana. Trip report, May 4, 1995, 20:23833 (R;US)
Tribology and coatings, 20:23882 (R;US)
Ultrasonic process for remediation of organics-contaminated groundwater/wastewater, 20:23337 (R;US)
User's guide to EAGLES Version 1.1: An electric- and gasoline-vehicle fuel-efficiency software package, 20:23812 (R;US)
User's manual for elegant Program Version 12.4, Manual Version 1, 20:24137 (R;US)
Users manual for tohtml: Producing true hypertext documents from LaTeX, 20:24956 (R;US)
Using ADIFOR 1.0 to compute Hessians, 20:24955 (R;US)
Versatile neutron NDA, 20:23406 (R;US)
Witness gun for the Argonne Wakefield Accelerator, 20:24171 (R;US)
Work plan for conducting an ecological risk assessment at J-Field, Aberdeen Proving Ground, Maryland, 20:24563 (R;US)

Argonne National Lab., IL (United States). Environmental Assessment Div.
Work plan for focused feasibility study of the toxic burning pits area at J-Field, Aberdeen Proving Ground, Maryland, 20:24562 (R;US)

Argonne National Lab., Washington, DC (United States)
Hazardous waste cleanup: A case study for developing efficient programs, 20:23687 (R;US)
Synthetic drilling muds: Environmental gain deserves regulatory recognition, 20:23068 (R;US)

Arizona State Univ., Tempe, AZ (United States)
Supercomputer modeling of volcanic eruption dynamics, 20:24747 (R;US)

The Center for the Study of Early Events in Photosynthesis. Final report, September 1, 1988–August 31, 1994, 20:23468 (R;US)

Arizona Univ., Tucson, AZ (United States). Dept. of Physics
Solar variability observed through changes in solar limb-darkening function and mean diameter. Progress report, 20:24761 (R;US)

Asotin County Conservation District, Clarkston, WA (United States). Landowner Steering Committee
Asotin Creek Model Watershed Plan, 20:24571 (R;US)

Associated Western Universities, Inc., Salt Lake City, UT (United States)
Modeling biologically reactive transport in porous media, 20:24609 (R;US)

Association Euratom-Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany)
Irradiation programme MANITU: Results of pre-examinations and Charpy tests with unirradiated materials, 20:23854 (R;DE;In German)

Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)
Implementing simulations of isotropic turbulence in highly parallel computers, 20:24763 (R;IT)
Induction heating in in-line strip production process, 20:23853 (R;IT;In Italian)

B

Babcock and Wilcox Co., Alliance, OH (United States)
Development of advanced, dry, SO_x/NO_x emission control technologies for high-sulfur coal. Final report, April 1, 1993–December 31, 1994, 20:23525 (R;US)

Battelle-Northwest, Richland, WA (United States). Pacific Northwest Lab.
Letter to D. R. Harbur, 20:25022 (R;US)

Bechtel National, Inc., San Francisco, CA (United States)
Refining and end use study of coal liquids. Sixth quarterly technical progress report, December 19, 1994–March 26, 1995, 20:22989 (R;US)

Berliner Kraft- und Licht (BEWAG)-AG, Berlin (Germany)
Wind power in Berlin, 20:23506 (I;DE;In German)

Bettis Atomic Power Lab., West Mifflin, PA (United States)
Preirradiation Data summary for the GRIT-II HTGR irradiation test specimens, 20:23553 (R;US)

Black and Veatch, Kansas City, MO (United States)
Externally-fired combined cycle: An effective coal fueled technology for repowering and new generation, 20:23518 (R;US)

Bonneville Power Administration, Portland, OR (United States)
Lower Columbia river terminal fisheries research project. Final environmental assessment, 20:23463 (R;US)

Brookhaven National Lab., Upton, NY (United States)
A Scanning Auger Microprobe analysis of corrosion products associated with sulfate reducing bacteria, 20:23836 (R;US)
Advanced alarm systems: Display and processing issues, 20:23584 (R;US)
Aircraft impact analysis for the HFBR. Revision 1, 20:23613 (R;US)
Alignment and survey of the elements in RHIC, 20:24063 (R;US)
ATF CO_2 laser system upgrade to terawatt peak power, 20:24182 (R;US)
Basic programs for the CO_2 system in seawater, 20:24618 (R;US)
Biochemical technology for the detoxification of geothermal brines and the recovery of trace metals, 20:23499 (R;US)
BNL ALARA Center: ALARA Notes, No. 9, 20:23535 (R;US)
Brookhaven highlights 1994, 20:24930 (R;US)
Colliding Crystalline Beams, 20:24107 (R;US)
Data resources for nuclear medicine, 20:24697 (R;US)
Dynamic response of a pair of walls retaining a viscoelastic solid, 20:23976 (R;US)
Effect of aging on the PWR Chemical and Volume Control System, 20:23628 (R;US)
Effect of groundwater on soil-structure interaction, 20:23586 (R;US)
Effects of selected thermophilic microorganisms on crude oils at elevated temperatures and pressures. Final report, 20:23069 (R;US)
Evaluation of potential severe accidents during low power and shutdown operations at Surry, Unit 1: Evaluation of severe accident risk during mid-loop operations. Main report. Volume 6. Part 1, 20:23588 (R;US)
Evaluation of potential severe accidents during low power and shutdown operations at Surry, Unit 1: Evaluation of severe accident risk during mid-loop operations. Volume 6, Part 2: Appendices, 20:23629 (R;US)
Experimental determination of linear optics including quadrupole rotations, 20:24302 (R;US)
Flat panel planar optic display. Revision 4/95, 20:24381 (R;US)
Fractal dynamics of earthquakes, 20:24743 (R;US)
Gas breakdown limits for inverse Cherenkov laser accelerators, 20:24064 (R;US)
Gas mass transfer for stratified flows, 20:24617 (R;US)
HEU age determination, 20:23381 (R;US)
Hybrid helical snakes and rotators for RHIC, 20:24183 (R;US)
Local alliance building for urban science education, 20:23673 (R;US)
MACS as a tool for international inspections, 20:23829 (R;US)
Methodological issues in the validation of complex human-machine systems, 20:23583 (R;US)
Modelling absorption and dilution of unconfined releases of hazardous gases by water curtains or monitors, 20:24451 (R;US)
Nondestructive examination of DOE high-level waste storage tanks, 20:23170 (R;US)
Orbit stability improvement at the NSLS x-ray ring, 20:24301 (R;US)
Phonon and intruder structures in neutron rich Cd nuclei: Extension to ^{122}Cd, 20:24807 (R;US)
Plant maintenance and aging management: Are they the same?, 20:23567 (R;US)
Quantum phase space theory for the calculation of v-j vector correlations, 20:24836 (R;US)
Quench antennas for RHIC quadrupole magnets, 20:24180 (R;US)
Research by industry at the National Synchrotron Light Source, 20:24059 (R;US)
Risk assessment for produced water discharges to Louisiana Open Bays, 20:23096 (R;US)
Skew quadrupole in RHIC dipole magnets at high fields, 20:24179 (R;US)
Structure and collectivity very far from stability: Coulomb excitation of radioactive nuclear beams in inverse kinematics, 20:24806 (R;US)
Surface crystallization in normal-alkanes and alcohols, 20:23951 (R;US)
Temperature stimulated reverse annealing of neutron induced damage in high resistivity silicon detectors, 20:24345 (R;US)
The Amtex DAMA Project: The Brookhaven contribution, 20:23711 (R;US)
The RHIC accelerating cavity prototype tuner, 20:24300 (R;US)
Transition radiation electron beam diagnostic study at ATF, 20:24181 (R;US)

Building Services Research and Information Association, Bracknell (United Kingdom). Building Energy Management Systems (BEMS) Centre
BEMS: Abstract book, 20:24739 (R;US)

Bureau of Mines, Pittsburgh, PA (United States). Pittsburgh Research Center
Ignitability testing for core drilling system. Final report, 20:23310 (R;US)

Bureau of Mines, Washington, DC (United States)
An architecture for an intelligent automatic generation control for electric power systems, 20:23639 (RA;US)
Application of neural networks for control of chaotic systems, 20:24976 (RA;US)
Assuring the performance of adaptive control systems, 20:24974 (RA;US)
Development of feed-forward neural network models for gas short-term load forecasting, 20:23121 (RA;US)
EPA's adaptive controls system research program for pollution prevention and clean technologies, 20:24968 (RA;US)
First flights of genetic-algorithm Kitty Hawk, 20:24972 (RA;US)
Foundations of neural networks, 20:24961 (RA;US)

Fuzzy logic controllers: From development to deployment, 20:24965 (RA;US)
Fuzzy models for pattern recognition, 20:24975 (RA;US)
Genetic algorithms, 20:24970 (RA;US)
Genetic Algorithms: A gentle introduction, 20:24969 (RA;US)
Hybrid systems for enhanced process control, 20:23640 (RA;US)
Industrial Applications of Fuzzy Logic at General Electric, 20:24966 (RA;US)

Japan Atomic Energy Research Inst., Tokyo (Japan)
Annual report of the Osaka Laboratory for Radiation Chemistry Japan Atomic Energy Research Institute, (No. 27). April 1, 1993 - March 31, 1994, 20:24937 (R;JP)
Attenuation coefficients of human tissues and tissue substitutes, 20:24721 (R;JP;In Japanese)
Bulk shielding experiment on a large SS316/water assembly bombarded by D-T neutrons. V. 1. Experiment, 20:24890 (R;JP)
Bulk shielding experiment on a large SS316/water assembly bombarded by D-T neutrons. V. 2. Analysis, 20:24891 (R;JP)
Compatibility test of blanket structural materials with beryllium sphere in helium gas environment, 20:24895 (R;JP)
Consistent calculations of fast neutron induced fission, (n,2n) and (n,3n) cross-sections for 71 isotopes of Th, Pa, U, Np, Pu, Am, Cm, Bk and Cf, 20:24817 (R;JP)
Corrosion fatigue behavior of zirconium in boiling nitric acid, 20:23858 (R;JP;In Japanese)
Design study on a 1MeV, 12.5MW neutral beam injector module for ITER, 20:24896 (R;JP)
Development of animation processing system, 20:24991 (R;JP;In Japanese)
Development of dual CO_2 laser interferometer for large tokamak, 20:24892 (R;JP)
Distribution behavior of 1-butanol in reprocessing solution, 20:23143 (R;JP;In Japanese)
Feasibility study on potential productivity of heat-resisting and advanced semiconductors by using the HTTR, 20:23600 (R;JP;In Japanese)
Heat transfer experiments on the cooling tubes for divertor plates under one-sided heating conditions, 20:24898 (R;JP)
Improvement of a three-dimensional atmospheric dynamic model and examination of its performance over complex terrain, 20:24544 (R;JP;In Japanese)
Joining technology development of advanced materials/SS304 by friction welding, 20:23859 (R;JP)
MCVIEW2: a radiation view factor computer program for three dimensional geometries using Monte Carlo method, 20:24990 (R;JP)
Methodologies for measurement and application of distribution coefficient, 20:23193 (R;JP;In Japanese)

Neutron spectral tailoring calculation in the JMTR. Feasible study on irradiation test simulating the fusion reactor condition, 20:24893 (R;JP;In Japanese)
Neutronic analysis of JRR-4 with low enriched uranium silicon dispersion type fuel of 3.8g/cm^3 uranium density, 20:23601 (R;JP;In Japanese)
Neutronics analysis on helium production control in stainless steel by neutron spectral tailoring in the JMTR, 20:23603 (R;JP;In Japanese)
Physical model simulation for resistivity tomography. An experimental tank and detection limit for a pole-pole array, 20:24589 (R;JP;In Japanese)
Pilot-scale test for electron beam flue gas treatment of coal-fired boiler, 20:23407 (R;JP;In Japanese)
Post irradiation examinations of uranium-plutonium mixed nitride fuel irradiated in JMTR (88F-5A capsule), 20:23579 (R;JP;In Japanese)
Radiation effects on carbon fiber-reinforced plastics for spacecraft materials, 20:23914 (R;JP;In Japanese)
Radiological safety of DT experiments at TFTR, 20:24899 (R;JP;In Japanese)
Research on fretting corrosion behavior of structural materials used in nitric acid environments for spent fuel reprocessing. 1. Difference in fretting corrosion resistance among austenitic stainless steel, Ti and Zr, 20:23140 (R;JP;In Japanese)
Research on fretting corrosion behavior of structural materials used in nitric acid environments for spent fuel reprocessing . 2. Effect of nitric acid temperature on fretting corrosion behavior of zirconium, 20:23857 (R;JP;In Japanese)
Results of physics measurement of the low-enriched uranium fuel core in the JMTR, 20:23602 (R;JP;In Japanese)
Review of 'cold fusion', 20:24866 (R;JP;In Japanese)
Review of experimental studies of zirconium carbide coated fuel particles for high temperature gas-cooled reactors, 20:23552 (R;JP)
Safety demonstration tests of air-ventilation system for the postulated explosive burning in a cell of fuel-reprocessing plant, 20:23142 (R;JP;In Japanese)
Study on the photoacoustic spectroscopy capabilities with remote detection for monitoring of actinide species in nuclear fuel reprocessing solutions, 20:23141 (R;JP)
Synthesis of complex plutonium oxides with alkaline-earth metals, 20:23540 (R;JP;In Japanese)
Test program development for ITER blanket design, 20:24897 (R;JP)
Thermochemical test of solvent in nuclear fuel reprocessing plants, 20:23144 (R;JP;In Japanese)
Tokamak assembly and tooling, 20:24894 (R;JP)
Trial fabrication and preliminary characterization of electrical insulator for liquid metal system, 20:23893 (R;JP)

Jet Propulsion Lab., Pasadena, CA (United States)
Thermoelectric material development. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:23743 (R;US)

Johns Hopkins Univ., Baltimore, MD (United States)
Fourth International Conference on Anticarcinogenesis and Radiation Protection: Supplement. Volume 54, No. 7, 20:24714 (R;US)

Joint Inst. for Nuclear Research, Dubna (Russian Federation)
π^+-Li^6 elastic and inelastic scattering, 20:24819 (IA;RU)
15. International symposium on nuclear electronics and International seminar CAMAC-92, 20:24357 (I;RU;In Russian)
25 years of operation of the LUEh-2000 Kharkov linac for physical programs, 20:24067 (IA;RU;In Russian)
A search for centrally produced non-q q-bar mesons in proton proton interactions at 450 GeV/c by using the CERN Ω spectrometer, 20:24795 (RA;RU)
Accelerating resonators with mechanical frequency tuning, 20:24223 (IA;RU;In Russian)
Acceleration of heavy ion beams at the IYaF AN RK cyclotron, 20:24071 (IA;RU;In Russian)
Acoustic effects in accelerator electrodynamic structures, 20:24082 (IA;RU;In Russian)
Adjustment of the UK - auxiliary magnetic ring of the ITEP accelerating complex, 20:24072 (IA;RU;In Russian)
Analysis of field harmonics of rectangular aperture magnets, 20:24229 (IA;RU;In Russian)
Apparatus method for correction of the ballistic deficit and charge losses on impurities into germanium detectors, 20:24365 (IA;RU;In Russian)
Application of ceramics, dielectric coatings and insulation materials in magnetic circuits structures of magnet coils, 20:24234 (IA;RU;In Russian)
Application of VME bus for automation of high energy physics experimental installations in JINR, 20:24360 (IA;RU;In Russian)
Automated control system of the MKM-21 multipurpose microtron, 20:24190 (IA;RU;In Russian)
Automation of radiation monitoring on JINR reactors, 20:24368 (IA;RU;In Russian)
Autonomous system for digital signal processing, 20:25028 (IA;RU;In Russian)
Beam loading of an active resonator in a stationary mode, 20:24121 (IA;RU;In Russian)
C-tau factory of the JINR accelerating-storage complex, 20:24318 (IA;RU;In Russian)
Calculation of an vacuum system of an accelerator of H$^-$ion intense beams, 20:24227 (IA;RU;In Russian)
Calculation of axial-symmetric magnetic fields at the presence of conducting shields with cuttings, 20:24115 (IA;RU;In Russian)
Calculation of beam radial quality in the U-120K cyclotron, 20:24113 (IA;RU;In Russian)
Calculation of nonstationary beam dynamics in an electron linac with short current pulse duration, 20:24125 (IA;RU;In Russian)
Calculation of three-dimensional electrostatic field of an accelerator structure on the base of two-dimensional analysis, 20:24114 (IA;RU;In Russian)
Charge exchange injection system kicker magnets pulse power supply, 20:24230 (IA;RU;In Russian)
Charged particle acceleration by a wake field in magnetoactive plasma waveguide, 20:24118 (IA;RU;In Russian)
Coefficient of a field over intensity on the surface of a corrugated waveguide, 20:24218 (IA;RU;In Russian)
Collisions of negative muons and hadrons with metastable atoms, 20:24840 (IA;RU)
Combined accelerating structure with optimized multi resonator buncher, 20:24219 (IA;RU;In Russian)
Complex of equipment for manufacturing and treatment of Nb/Cu based superconducting resonators, 20:24215 (IA;RU;In Russian)
Compression chain with prepulse compensation, 20:24231 (IA;RU;In Russian)
Control by some operating mechanisms in experimental installations TEXT, DVR on the IBR-2, IBR-30 reactors, 20:24367 (IA;RU;In Russian)
Control system for a programmable multichannel high-voltage source, 20:24366 (IA;RU;In Russian)
Control system of high-current resonance electron linac for radiation technologies, 20:24189 (IA;RU;In Russian)
Correction of nuclotron magnetic field, 20:24112 (IA;RU;In Russian)
Corrugated plasma column as a slowing-down structure for an accelerator, 20:24119 (IA;RU;In Russian)
Covariant cluster dynamics of nucleons and mesons, 20:24798 (IA;RU)
Current status of $\pi\pi$-scattering experiments, 20:24797 (IA;RU)
Data acquisition system for positron emission tomograph, 20:24364 (IA;RU;In Russian)
Development and performance testing of elements of power RF systems of linear electron-positron colliders, 20:24202 (IA;RU;In Russian)
Dipole and quadrupole magnets of the K4 ring of the K4 - K10 heavy ion storage complex, 20:24314 (IA;RU;In Russian)
Direct current stabilizers for supplying magnet coils of iron-core current channel of the JINR phasotron, 20:24232 (IA;RU;In Russian)
Dynamic aperture measurement at the H-100 Kharkov storage ring, 20:24323 (IA;RU;In Russian)
Elastic π^+ scattering on polarized ^{3}He at δresonance energies, 20:24820 (IA;RU)
Electrodynamic characteristics of accelerating structure of the Moscow meson factory radionuclide linear accelerator (LURAN), 20:24075 (IA;RU;In Russian)
Electron acceleration by nonlinear wakefield in a plasma with mobile ions, 20:24127 (IA;RU;In Russian)

Excitation of coaxial sections of a waveguide structure, 20:24222 (IA;RU;In Russian)
Experience of operation with normal-conducting accelerating structures in the continuous-wave mode, 20:24079 (IA;RU;In Russian)
Experimental study on a cm-wave range power pulse magnicon, 20:24201 (IA;RU;In Russian)
Experimental study on collective effects in the VEPP - 3 storage ring in centimeter length range of a bunch, 20:24325 (IA;RU;In Russian)
Experimental study on high-voltage nanosecond generators of the 'Sibir'-2' storage ring injection system, 20:24312 (IA;RU;In Russian)
Fast coder of analog signals, 20:24359 (IA;RU;In Russian)
Fast monitoring and control system of two-dimensional current distribution along proton beam profile, 20:24191 (IA;RU;In Russian)
Fastbus 64-digital input register with buffer memory, 20:24994 (IA;RU;In Russian)
Formation of deeply bound pionic atoms, 20:24843 (IA;RU)
Free electron laser for the 2 x 1 TeV photon collider, 20:24068 (IA;RU;In Russian)
General formula for the coalescence model and an evidence of non-existence of Z=-1 pi-neuts, 20:24842 (IA;RU)
Generators for testing of spectrometric units performance, 20:24995 (IA;RU;In Russian)
Heavy ion accelerating-storage complex (IYal, Kiev), 20:24310 (IA;RU;In Russian)
High-voltage pulse generator based on inductive-coupled circuits, 20:24225 (IA;RU;In Russian)

Laguna Petroleum Corp., Midland, TX (United States)
An integrated study of the Grayburg/San Andres Reservoir, Foster and South Cowden Fields, Ector County, Texas. Quarterly technical progress report No. 3, February 1, 1995–April 30, 1995, 20:23062 (R;US)

Landtechnischer Verein in Bayern e.V., Freising (Germany)
Use of renewable energy sources in Bavaria - state of the art and potential assessment. A climate protection study, 20:23699 (R;DE;In German)

Lawrence Berkeley Lab., CA (United States)
B^--decay and cosmic-ray half-life of ^{54}Mn, 20:24811 (R;US)
A compact permanent magnet cyclotrino for accelerator mass spectrometry, 20:23987 (RA;US)
A design method for multiple tube gas-cooled electrical leads for the g-2 superconducting magnets, 20:24328 (R;US)
A high charge state heavy ion beam source for HIF, 20:24903 (R;US)
A population balance model for transient and steady-state foam flow in Boise sandstone, 20:23089 (R;US)
A simple procedure for estimating the effective hydraulic conductivity of a two-dimensional saturated or partly-saturated fracture network, 20:23212 (R;US)
A study of the suitability of ferrite for use in low-field insertion devices, 20:23920 (RA;US)
BIG KARL and COSY: Examples for high performance magnet design taught by "Papa Klaus", 20:24238 (RA;US)
Calculated and measured fields in superferric wiggler magnets, 20:24239 (RA;US)
Comparison of conventional and novel quadrupole drift tube magnets inspired by Klaus Halbach, 20:24240 (RA;US)
Concept of quasi-periodic undulator - control of radiation spectrum, 20:24241 (RA;US)
Differential geometry on Hopf algebras and quantum groups, 20:24756 (R;US)
Dynamics of inelastic and reactive gas-surface collisions, 20:23963 (R;US)
Effective transmissivity of two-dimensional fracture networks, 20:23213 (R;US)
Electrical and electromagnetic methods for reservoir description and process monitoring. Annual report, October 1, 1992–September 30, 1993, 20:23064 (R;US)
Engineering conceptual design of the relativistic Klystron two-beam accelerator based power source for 1-TeV next linear collider, 20:24237 (R;US)
Field errors in hybrid insertion devices, 20:24242 (RA;US)
Field of a helical Siberian Snake, 20:24243 (RA;US)
Foam flow through a transparent rough-walled rock fracture, 20:23088 (R;US)
Fundamental studies of the mechanism of catalytic reactions with catalysts effective in the gasification of carbon solids and the oxidative coupling of methane. Quarterly report, January 1, 1995–March 31, 1995, 20:23445 (R;US)
Halbach array motor/generators: A novel generalized electric machine, 20:23989 (RA;US)
Halbach arrays in precision motion control, 20:23988 (RA;US)
Harmonic generation with multiple wiggler schemes, 20:24038 (RA;US)
Impulse-based methods for fluid flow, 20:24999 (R;US)
Insertion device calculations with mathematica, 20:24244 (RA;US)
Lawrence Berkeley Laboratory FY 1995 site development plan, 20:24939 (R;US)
Low-field permanent magnet quadrupoles in a new relativistic-klystron two-beam accelerator design, 20:24245 (RA;US)
Multifrequency crosshole EM imaging for reservoir characterization. FY 1994 annual report, 20:23063 (R;US)
Nanoindentation and nanoscratching of hard carbon coatings for magnetic disks, 20:23906 (R;US)
Office technology energy use and savings potential in New York. Final report, 20:23758 (R;US)
On the smoothness of electric fields near plane gratings of cylindrical conductors, 20:24766 (RA;US)
Operation of a small-gap undulator on the NSLS X-ray Ring, 20:24246 (RA;US)
Optimum coil shape for a given volume of conductor to obtain maximum central field in an air core solenoid, 20:23990 (RA;US)
PEP-III magnet power conversion systems: Power supplies for large magnet strings, 20:24341 (R;US)
Photon-photon colliders, 20:24800 (R;US)
Physics with the collider detectors at RHIC and the LHC, 20:24377 (R;US)
Powerful electrostatic FEL: Regime of operation, recovery of the spent electron beam and high voltage generator, 20:24039 (RA;US)
Quantum theory of chemical reaction rates, 20:23962 (R;US)
Radiation and gas conduction heat transport across a helium dewer multilayer insulation system, 20:24760 (RA;US)
Radioisotope yields from 1.85-GeV protons on Mo and 1.85- and 5.0-GeV protons on Te, 20:24826 (R;US)
Resonant soft x-ray fluorescence studies of novel materials, 20:23897 (R;US)
Simple surface structure determination from Fourier transforms of angle-resolved photoemission extended fine structure, 20:24848 (RA;US)
Some ideas on the choice of designs and materials for cooled mirrors, 20:24767 (RA;US)
Surveying the monument system at Lawrence Berkeley Laboratory's Advanced Light Source accelerator, 20:24090 (R;US)
T2VOC user's guide, 20:24594 (R;US)
The dynamics of fragment formation, 20:24825 (R;US)
The first insertion devices at SSRL - some personal recollections, 20:24247 (RA;US)
The "first" problem, 20:24904 (RA;US)
Transition undulator radiation as bright infrared sources, 20:24248 (RA;US)
Use of the Halbach perturbation theory for the multipole design of the ALS storage ring sextupole, 20:24249 (RA;US)
Weathering products of basic rocks as sorptive materials of natural radionuclides, 20:23214 (R;US)

Lawrence Berkeley Lab., CA (United States). SSC Central Design Group
Interim report, 20:24100 (R;US)
Magnet measurement workshop, 20:24298 (R;US)
Report of the Task Force on detector Research and Development for the Superconducting Super Collider, 20:24374 (R;US)
Report of the task force on SSC commissioning and operations, 20:24098 (R;US)

Lawrence Livermore National Lab., CA (United States)
A computational method for comparing the behavior and possible failure of prosthetic implants, 20:24704 (R;US)
A lightweight high performance dual-axis gimbal for space applications, 20:23799 (R;US)
A new insensitive explosive that has moderate performance and is low cost: 2,4-Dinitroimidazole, 20:24421 (R;US)
A parallel 3D ALE code for metal forming analyses, 20:23875 (R;US)
A qualitative study of internal wave ship wakes: Dependence on environmental conditions and experimental parameters, 20:24397 (R;US)
A refuelable zinc/air battery for fleet electric vehicle propulsion, 20:23816 (R;US)
A search for optical counterparts of gamma-ray bursts. Final report, 20:24771 (R;US)
A smooth transition to hydrogen transportation fuel, 20:23824 (R;US)
A solar module fabrication process for HALE solar electric UAVs, 20:23479 (R;US)
Advanced source studies on laser produced plasmas for EUV lithography, 20:24396 (R;US)
Advances in the chemical conversion of energetic materials to higher value products, 20:24425 (R;US)

Amplification of femtosecond pulses to above 1 J with large aperture Cr:LiSrAlF$_6$ amplifiers, 20:24054 (R;US)
An adaptive multifluid interface-capturing method for compressible flow in complex geometries, 20:24024 (R;US)
An expanded porphyrin approach toward transactinium chelation and the development of porphyrin-coated optical fibers as potential actinide sensors, 20:24393 (R;US)
Analysis of automated highway system risks and uncertainties. Volume 5, 20:23771 (R;US)
Analysis of compressive fracture in rock using statistical techniques, 20:23937 (R;US)
Analysis of near-field thermal and psychometric waste package environment using ventilation, 20:23250 (R;US)
Analytic electrostatic solution of an axisymmetric accelerator gap, 20:24153 (R;US)
Applications of microlens-conditioned laser diode arrays, 20:24053 (R;US)
APST interfaces in LINCS, 20:25014 (R;US)
Broad-band characterization of the complex permittivity and permeability of materials, 20:23873 (R;US)
Capacitive deionization of water: An innovative new process, 20:23969 (R;US)
Climate signal and weather noise, 20:24554 (R;US)
Coating strategy for enhancing illumination uniformity in a lithographic condenser, 20:24056 (R;US)
Compilation of data for isotope mapping of groundwater in the Central Valley of California, 1993-1995, 20:24613 (R;US)
Computational fluid dynamics modeling for emergency preparedness and response, 20:24552 (R;US)
Copper electroplating process for sub-half-micron ULSI structures, 20:24058 (R;US)
Core, edge, and divertor LIDAR Thomson scattering for ITER, 20:24880 (R;US)
Corrosion of candidate materials in Lake Rotokawa geothermal exposure, 20:23930 (R;US)
Critical illumination condenser for extreme ultraviolet projection lithography, 20:24057 (R;US)
Decay of the ^{194}Pb superdeformed band, 20:24813 (R;US)
Decomposable Mandrel Project. Progress report, 20:24912 (R;US)
Derivation of preliminary specifications for transmitted wavefront and surface roughness for large optics used in inertial confinement fusion, 20:24913 (R;US)
Design of a five-axis flux-gate magnetic-gradiometer system Tracking Code No. 93-SR-035, 20:24404 (R;US)
Detailed and global chemical kinetics model for hydrogen, 20:23416 (R;US)
Development of a bipolar cell for electrochemical production of lithium, 20:23877 (R;US)
Development of a sensor and control system for the production of titanium matrix composites, 20:23876 (R;US)
Development of high damage threshold optics for petawatt-class short-pulse lasers, 20:24011 (R;US)
Development of the Emission Measurement and Information Tracking System (EMITS) for regulatory analysis, 20:24551 (R;US)
DEWPOINT. Final report, 20:24049 (R;US)
Diagnostics for the detection and evaluation of laser induced damage, 20:24923 (R;US)
Diode-pumped solid state laser for inertial fusion energy, 20:24914 (R;US)
Disposition of plutonium in deep boreholes, 20:23252 (R;US)
DISSS/PSDB - Personnel Security Database Modernization Project: Compilation of data gathered from DOE Operations Office's site visits, 20:23402 (R;US)
DOE natural phenomenal hazards design and evaluation criteria, 20:23371 (R;US)
EDEN. Holographic Methods in X-ray Crystallography, 20:24985 (CM;US)
Energy & technology review, April 1995, 20:24907 (R;US)
Enhancing tensile ductility of a particulate-reinforced aluminum MMC by lamination with Mg-9% Li alloy, 20:23931 (R;US)
Ensemble techniques for seasonal prediction, 20:24555 (R;US)
Environmental monitoring plan - environmental monitoring section. Revision 1, 20:24612 (R;US)
EUV lithography cost of ownership analysis, 20:24055 (R;US)
EUVE photometry of SS Cygni: Dwarf nova outbursts and oscillations, 20:24772 (R;US)
Evaporation monitoring and composition control of alloy systems with widely differing vapor pressures, 20:24007 (R;US)
Expedited demonstration of molten salt mixed waste treatment technology. Addendum 1, 20:23247 (R;US)
Experimentally determined profiles of fast wave current drive on DIII-D, 20:24864 (R;US)
Extrapolation of the Dutch 1 MW tunable free electron maser to a 5 MW ECRH source, 20:24879 (R;US)
Failure characterization of nodular defects in multi-layer dielectric coatings, 20:23932 (R;US)
Fatigue expectations in a molybdenum/silicon multilayer under pulsed soft X-ray radiation, 20:24392 (R;US)
Final report task order number B239641 between the Regents of the University of California and Institute of Experimental Physics task 2: Switch development., 20:24908 (R;US)
Gas-filled targets for large scalelength plasma interaction experiments on Nova, 20:24918 (R;US)
Hints on the use of the PCMDI Visualization and Computation System (VCS), 20:24751 (R;US)
HiRes camera and LIDAR ranging system for the Clementine mission, 20:24440 (R;US)
Hydrogen chemisorption on diamond surfaces. Final report, 20:23968 (R;US)
Infrared hyperspectral imaging results from vapor plume experiments, 20:24395 (R;US)
Inner-shell photo-ionized X-ray laser schemes for low-Z elements, 20:24835 (R;US)
Interim cryo-cooler/detector report, 20:24376 (R;US)
Investigation of the reaction rates between uranium and liquid aluminum, 20:23874 (R;US)
Involving users in the design cycle for parallel tools second period September 1, 1994–January 31, 1995, 20:25011 (R;US)
Laboratory studies of a hydrothermal pretreatment process for municipal solid waste, 20:23808 (R;US)
Large-aperture, high-damage-threshold optics for beamlet, 20:24911 (R;US)
Large-eddy simulation of the Rayleigh-Taylor instability on a massively parallel computer, 20:25018 (R;US)
Laser properties of an improved average-power Nd-doped phosphate glass, 20:24051 (R;US)
Laser-induced damage in dielectrics with nanosecond to subpicosecond pulses. I. Experimental. Part 1, 20:24919 (R;US)
Laser-induced damage in dielectrics with nanosecond to subpicosecond pulses. II. Theory, 20:24920 (R;US)
Laser-induced fluorescence diagnostic for the LEM turbulent hydrodynamics experiment, 20:24850 (R;US)
Lawrence Livermore National Laboratory safeguards and security quarterly progress report to the US Department of Energy quarter ending September 30, 1994, 20:23401 (R;US)
Lithological and rheological constraints on fault rupture scenarios for ground motion hazard prediction. Revision 1, 20:24752 (R;US)
LLNL Electrical Safety Committee Summary report for 1993 and 1994, 20:23661 (R;US)
LLNL state-of-the-art codes for source calculations, 20:25012 (R;US)
Loch Linnhe experiment 1994: Background stratification and shear measurements. Part 1: Profile summary and dispersion relations, 20:24750 (R;US)
Magnetic x-ray circular dichroism in nickel-gold multilayers, 20:23935 (R;US)
Magnetron cathodes in plasma electrode pockels cells, 20:24387 (PA;US)
Mechanisms of protein and virus crystal growth: An atomic force microscopy study of Canavalin crystallization, 20:24706 (R;US)
MID-IR detection: Detector circuitry and noise, 20:24378 (R;US)
Modeling of ablation by photospallation using the computer program PUFF/DFRACT, 20:24707 (R;US)
Modeling the dynamic crush of impact mitigating materials, 20:24012 (R;US)
Modeling, monitoring and control based on neural networks, 20:24013 (R;US)

Molecular dynamics modeling of ultrathin amorphous carbon films, 20:23936 (R;US)
Molten salt destruction of energetic material wastes as an alternative to open burning, 20:24411 (R;US)
Molten salt destruction of energetic material wastes as an alternative to open burning. Revision 1, 20:24422 (R;US)
Monte Carlo study of a high-sensitivity gamma-ray detection system, 20:24375 (R;US)
National Ignition Facility design, performance, and cost, 20:24922 (R;US)
Near-infrared camera for the Clementine mission, 20:24437 (R;US)
Near-surface current meter array measurements of internal gravity waves, 20:24010 (R;US)
New diode wavelengths for pumping solid-state lasers, 20:24052 (R;US)
New infrared solid state laser materials for CALIOPE, 20:24008 (R;US)
NIF target fill, transport and insertion cryostat, 20:24909 (R;US)
Numerical simulation of a wave-guide mixing layer on a Cray C-90, 20:24025 (R;US)
OH generation in steam-air pulsed corona, 20:24553 (R;US)
Pencil beam radar selectivity of ocean wave spectra, 20:24640 (R;US)
PEP-III magnet power conversion systems: Power supplies for large magnet strings, 20:24341 (R;US)
Photolytic destruction of oxalate in aqueous mixed waste, 20:23948 (R;US)
Plasma arc heated secondary combustion chamber, 20:23798 (R;US)
Pre-shot predictions and instrumentation of the KUCHEN experiment, 20:24433 (R;US)
Preliminary report on the implications of mining practices in an open-pit gold mine for monitoring of a comprehensive Test Ban Treaty, 20:24434 (R;US)
Process simulator for time-dependent material and energy flow in a continuous casting system, 20:24009 (R;US)
Production of hollow microspheres for inertial confinement fusion experiments, 20:24916 (R;US)
Progress in heavy-ion drivers for inertial fusion, 20:24915 (R;US)
Progress reports for October 1994 – Joint UK/US Radar Program, 20:24402 (R;US)
Progress reports for period November 1–30, 1994 – Joint UK/US Radar Program, 20:24403 (R;US)
Properties of transition metal-doped zinc chalcogenide crystals for tunable IR laser radiation, 20:23933 (R;US)
Pyrochemical processing of Idaho Chemical Processing Plant (ICPP) High Level Waste (HLW) calcine, 20:23947 (R;US)
Radical oxidation automotive de-NO_x, 20:23818 (R;US)
Rapid growth of diamond-like-carbon films by copper vapor laser ablation, 20:23934 (R;US)
Recent test results of a warm gas pumped monopropellant propulsion system, 20:24006 (R;US)
Regulatory issues for deep borehole plutonium disposition, 20:23403 (R;US)
Resonant soft x-ray fluorescence studies of novel materials, 20:23897 (R;US)
Reusing main-charge explosives from the demilitarization of weapons, 20:24423 (R;US)
Reusing main-charge explosives from the demilitarization of weapons. Revision 1, 20:24424 (R;US)
Review of hohlraum coupling, 20:24921 (R;US)
Review of sensors for the in situ chemical characterization of the Hanford underground storage tanks, 20:23246 (R;US)
SERS internship: Spring 1994 abstracts and research papers, 20:23718 (R;US)
Small-business technology transfer program, case number 93119 - second harmonic generation for Lee Laser Inc.: Resonator designs, 20:24048 (R;US)
Smile (System/Machine-Independent Local Environment), 20:25013 (R;US)
Spectroscopy and decay kinetics of Pr^{3+}-doped chloride crystals for 1300-nm optical amplifiers, 20:24394 (R;US)
Spontaneous origin of topological complexity in the cerebral cortex, 20:24709 (R;US)
Star tracker stellar compass for the Clementine mission, 20:24439 (R;US)
Status report on source properties important for discrimination, 20:23830 (R;US)
Temperature measurements of shock-compressed deuterium, 20:24910 (R;US)
Terminal ballistic experiments for the development of turbine engine blade containment technology, 20:24029 (R;US)
Test results of a combined distributed ion pump/non-evaporable getter pump design developed as a proposed alternative pumping system for the PEP-II asymmetric B-Factory collider, 20:24339 (R;US)
Test results of pre-production prototype distributed ion pump design for the PEP-II Asymmetric B-Factory collider, 20:24340 (R;US)
The Aegis initiative: An integrated, real-time, environmental monitoring and response management capability. Final report, 20:23708 (R;US)
The BaBar cesium iodide electromagnetic calorimeter, 20:24379 (R;US)
The Beaverhead impact structure, SW Montana and Idaho: Implications for the regional geology of the western U.S., 20:24753 (R;US)

Environmental restoration risk-based prioritization work package planning and risk ranking methodology. Revision 2, 20:23357 (R;US)

Lockheed Martin Specialty Components, Inc., Largo, FL (United States)
Pinellas Plant Annual Site Environmental Report for calendar year 1994, 20:23361 (R;US)

Los Alamos National Lab., NM (United States)
^{13}C relaxation in an RNA hairpin, 20:24686 (RA;US)
A diethyl phosphonate containing oxazoline: Synthesis and characterization of monomer and homopolymer, 20:23961 (R;US)
A specialized boundary element algorithm developed to calculate the state of stress in the Anza Gap, San Jacinto Fault Zone, Southern, CA, 20:24746 (R;US)
A theoretical study of the electron-proton instability in a long proton pulse, 20:24131 (R;US)
A three-phase centrifuge to minimize waste from production tank bottoms and sludges: An economic analysis, 20:23095 (R;US)
Accident selection methodology for TA-55 FSAR, 20:23359 (R;US)
AGEX II: Technical quarterly, Volume 2, 20:24037 (R;US)
An analog edge detector with simultaneous background suppression, 20:24388 (PA;US)
Application of a transverse phase-space measurement technique for high-brightness, H^- beams to the GTA H^- beam, 20:24759 (R;US)
Application of heteronuclear couplings to conformational analysis of oligonucleotides, 20:24692 (RA;US)
Application to transfer radioactive waste to the Nevada Test Site, 20:23946 (R;US)
Aquatic macroinvertebrates and water quality of Sandia Canyon, Los Alamos National Laboratory, November 1993–October 1994, 20:24736 (R;US)
Assessment of the PIUS physics and thermal-hydraulic experimental data bases, 20:23619 (R;US)
Biosynthetic incorporation of telluromethionine into dihydrofolate reductase and crystallographic analysis of the distribution of tellurium atoms in the protein molecule, 20:24671 (RA;US)
Carbohydrates/nucleosides/RNA-DNA-ligand interactions, 20:24668 (RA;US)
Carbon-assisted flyer plates, 20:23996 (PA;US)
Characterization of PEM fuel cell membrane-electrode-assemblies by electrochemical methods and microanalysis, 20:23747 (R;US)
Characterization of three dimensional fiber orientation in short-fiber composites, 20:23916 (R;US)
Characterization of vegetation properties: Canopy modeling of pinyon-juniper and ponderosa pine woodlands; Final report. Modeling topographic influences on solar radiation: A manual for the SOLARFLUX model, 20:24593 (R;US)
Characterizing size dependence of ceramic-fiber strength using modified Weibull distribution, 20:23918 (R;US)
Complex DNA structures and structures of DNA complexes, 20:24683 (RA;US)
Conformational study of C8 diazocine turn mimics using $^3J_{CH}$ coupling constants with ^{13}C in natural abundance, 20:24669 (RA;US)
Desert Research Institute cloud droplet videometer measurements in support of MASTEX, 20:24545 (R;US)
Determination of water movement in the unsaturated zone at Yucca Mountain using chloride, bromide, and chlorine isotopes as environmental tracers. Final report, 20:23210 (R;US)
Direct fiber strengthening in three dimensional random-oriented short-fiber composites, 20:23917 (R;US)
Ecological surveys of the proposed high explosives wastewater treatment facility region, 20:23328 (R;US)
Electron clearing in the Los Alamos Proton Storage Ring, 20:24130 (R;US)
Epitaxial $SrRuO_3$ films, 20:24857 (PA;US)
FY94 CAG trip reports, CAG memos and other products: Volume 2. Final report, 20:23209 (R;US)
GHz nuclear magnetic resonance, 20:24370 (RA;US)
Heatpipe space power and propulsion systems, 20:23559 (R;US)
Heteronuclear cross-polarization in multinuclear multidimensional NMR: Prospects for triple-resonance CP, 20:24679 (RA;US)
High-resolution polypeptide structure and dynamics in anisotropic environments: The gramicidin channel, 20:24657 (RA;US)
Hydrogen program combustion research: Three dimensional computational modeling, 20:23415 (R;US)
Integrated chemical/biological treatment of paint stripper mixed waste: Metals toxicity and separation, 20:23360 (R;US)
Interval neural networks, 20:24998 (R;US)
Isotope labeling for NMR studies of macromolecular structure and interactions, 20:24654 (RA;US)
Isotopic chirality, 20:24658 (RA;US)
Landau-Ginzburg model of interphase boundaries in CsCl-type ferroelastics due to M^-_5 mode instability: $LaAg_{1-x}In_x$, 20:23860 (R;US)
Low Energy Accelerator Laboratory Technical Area 53, Los Alamos National Laboratory. Environmental assessment, 20:23691 (R;US)
LRAD surface monitoring results at TA-21, 20:23330 (R;US)
Magnetic resonance studies of isotopically labeled paramagnetic proteins: (2FE-2S) ferredoxins, 20:24661 (RA;US)
Measurement of CO_2 and N_2O at nanomolar amounts using continuous-flow isotope-ratio mass spectrometry (CF-IRMS), 20:24675 (RA;US)
Mechanism of phosphoryl transfer and protein-protein interaction in the PTS system-an NMR study, 20:24676 (RA;US)
Mechanistic studies of 3-deoxy-D-manno-octulosonic acid 8-phosphate synthase, 20:24678 (RA;US)
Mixed waste focus area alternative technologies workshop, 20:23211 (R;US)
Ner protein of phage Mu: Assignments using $^{13}C/^{15}N$-labeled protein, 20:24694 (RA;US)
Neutron scattering with deuterium labeling reveals the nature of complexes formed by Ca^{2+}-binding proteins and their regulatory targets, 20:24664 (RA;US)
New strategy for stable-isotope-aided, multidimensional NMR spectroscopy of DNA oligomers, 20:24685 (RA;US)
NMR studies of bent DNA using ^{13}C-enriched samples, 20:24695 (RA;US)
NMR studies of isotopically labeled RNA, 20:24687 (RA;US)
NMR studies of two spliced leader RNAs using isotope labeling, 20:24691 (RA;US)
Oxygen chemistry in biology: Vibrational spectroscopy, stable isotopes, and future applications, 20:24655 (RA;US)
Parallel sphere rendering, 20:24997 (R;US)
Penning trap and resistive cooling of protons. Final technical report, May 1993–March 1995, 20:24834 (R;US)
Peptides and proteins, 20:24667 (RA;US)
Phase-stable, microwave FEL amplifier, 20:24236 (R;US)
Preparation of diamond-like carbon and boron nitirde films by high-intensity pulsed ion beam deposition, 20:23915 (R;US)
Radionuclide concentrations in vegetation at radioactive-waste disposal Area G during the 1994 growing season, 20:23208 (R;US)
Recent progress on beam stability study in the PSR, 20:24132 (R;US)
REDOR NMR of stable-isotope-labeled protein binding sites, 20:24662 (RA;US)
Relationships between processing temperature and microstructure in isothermal melt processed Bi-2212 thick films, 20:23894 (R;US)
Renewal: Continential lithosphere evolution as a function of tectonic environment, 20:24748 (R;US)
RNA structure and scalar coupling constants, 20:24688 (RA;US)
SAMFT3D: Single-phase and multiphase flow and transport in 3 dimensions. Version 1.0, Documentation and user's guide, 20:24592 (R;US)
Selection of a preferred initial access for the exploratory studies facility, 20:23207 (R;US)
Selective ^2H and ^{13}C labeling in NMR analysis of solution protein structure and dynamics, 20:24660 (RA;US)

Sequence-specific ^{1}H, ^{13}C, and ^{15}N resonance assignments for intestinal fatty-acid-binding protein complexed with palmitate (15.4 kDA), 20:24670 (RA;US)
Simulational studies of the Farley-Buneman in the equatorial electrojet, 20:24765 (R;US)
Stable-isotope-labeled carbohydrates and nucleosides: Synthesis and applications in chemistry and biology, 20:24663 (RA;US)
Stereoselective synthesis of stable-isotope-labeled amino acids, 20:24665 (RA;US)
Stereospecific assignments of glycine in proteins by stereospecific deuteration and ^{15}N labeling, 20:24672 (RA;US)
Structural studies on an internal loop from a hairpin ribozyme, 20:24690 (RA;US)
Structural studies on leukaemia inhibitory factor, 20:24674 (RA;US)
Structures of larger proteins in solution: Three- and four-dimensional heteronuclear NMR spectroscopy, 20:24659 (RA;US)
Subpicosecond, ultra-bright electron injector, 20:24235 (R;US)
Supercomputer modeling of volcanic eruption dynamics, 20:24747 (R;US)
Synthesis and applications of ^{13}C glycerol, 20:24677 (RA;US)
Synthesis and applications of selectively ^{13}C-labeled RNA, 20:24693 (RA;US)
Synthesis and biosynthesis of ^{13}C-, ^{15}N-labeled deoxynucleosides useful for biomolecular structural determinations, 20:24689 (RA;US)
Synthesis and NMR of ^{15}N-labeled DNA fragments, 20:24684 (RA;US)
Table of DOE-STD-1027-92 Hazard Category 3 threshold quantities for the ICRP-30 list of 757 radionuclides: LANL fact sheet, 20:24722 (R;US)
The design and characterization of toroidal-shaped Nova hohlraums that simulate National Ignition Facility plasma conditions for plasma instability experiments, 20:24902 (R;US)
The insensitive high explosive triaminotrinitrobenzene (TATB): Development and characterization, 1888 to 1994, 20:24415 (R;US)
The modification and application of RAMS computer code. Final report, 20:23329 (R;US)
The role of composition gradients in the evolution of uranus and neptune. Progress report, 1 January 1994–1 September 1994, 20:24755 (R;US)
The rotationally improved Skyrmion, or RISKY, 20:24785 (R;US)
Through-the-electrode model of a proton exchange membrane fuel cell with independently measured parameters, 20:23746 (R;US)
Time-resolved infrared studies of protein conformational dynamics, 20:24666 (RA;US)
TRANSIMS: Transportation analysis and simulation system, 20:23767 (R;US)
Uniform ^{15}N- and $^{15}N/^{13}C$-labeling of proteins in mammalian cells and solution structure of the amino terminal fragment of u-PA, 20:24673 (RA;US)
Updated TRAC analysis of an 80% double-ended cold-leg break for the AP600 design, 20:23620 (R;US)
Use of specifically ^{15}N-labeled histidine to study structures and mechanisms within the active sites of serine proteinases, 20:24656 (RA;US)
Using the force to write parallel HEP programs, 20:24996 (R;US)

M

Management and Technical Consultants, Inc., Columbia, MD (United States)
Development of a coal fired pulse combustor for residential space heating. Technical progress report, October–December 1986, 20:23035 (R;US)
Development of a coal fired pulse combustor for residential space heating. Technical progress report, January–March 1987, 20:23036 (R;US)
Development of a coal fired pulse combustor for residential space heating. Technical progress report, April–June 1987, 20:23037 (R;US)
Development of a coal fired pulse combustor for residential space heating. Technical progress report, July–September 1987, 20:23038 (R;US)
Development of a coal fired pulse combustor for residential space heating: Phase 1-A. Technical progress report, June–August 1988, 20:23039 (R;US)

Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States)
Sonic enhanced ash agglomeration and sulfur capture. Technical progress report, January 1995–March 1995, 20:23015 (R;US)

Martin Marietta Astro Space, King of Prussia, PA (United States)
Monthly technical progress report, May 29, 1995–July 2, 1995, 20:23558 (R;US)

Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (United States)
Size reduction of hemispherical explosive shells by waterjet, 20:24414 (R;US)
Treatment and recycle of high explosive contaminated water, 20:24413 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (United States). Earth Resources Lab.
Reservoir characterization by cross-hole seismic imaging. Final report, September 15, 1989–June 30, 1994, 20:23066 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center
Impurity transport theory for text and ASDEX tokamak. Final report, September 25, 1989–November 24, 1990, 20:24861 (R;US)

Max-Planck-Institut fuer Meteorologie, Hamburg (Germany)
Stratospheric climate and variability from a general circulation model and observations. Pt. 2. Results for March-May, June-August and September-November, 20:24536 (R;DE)
The 19th century discussion of climate variabilility and climate change: analogies for the present debate?, 20:24538 (R;DE)
The reduction of complex dynamical systems using principal interaction patterns, 20:24535 (I;DE)
The role of water vapor and convection during the Central Equatorial Pacific Experiment (CEPEX) from observations and model simulations, 20:24537 (R;DE)
The water vapour continuum and its representation in ECHAM4, 20:24540 (R;DE)
Tropical intraseasonal oscillation appearing in operational analyses and in a family of general circulation models, 20:24539 (R;DE)

Max-Planck-Institut fuer Plasmaphysik, Garching (Germany)
Max-Planck-Institut fuer Plasmaphysik. Annual report 1994, 20:24889 (I;DE)

Mechanical Technology, Inc., Latham, NY (United States)
Interactive Computer-Enhanced Remote Viewing System (ICERVS). Phase 2, 20:23981 (R;US)

Medical Univ. of South Carolina, Charleston, SC (United States)
Environmental Hazards Assessment Program quarterly report, January–March 1995, 20:24729 (R;US)
Environmental hazards assessment program. Annual report, July 1, 1994–June 30, 1995, 20:24730 (R;US)
Environmental Hazards Assessment Program. Quarterly report, April–June 1995, 20:24731 (R;US)
Geo-coding of health and demographic data as a resource for environmental incidents preparedness and response, 20:24715 (R;US)

Medical Univ. of South Carolina, Charleston, SC (United States). Dept. of Biometry and Epidemiology
Cancer and birth defects surveillance system for communities around the Savannah River Site. Phase 1, Technical progress report: Cancer, 20:23355 (R;US)

Membrane Technology and Research, Inc., Menlo Park, CA (United States)
Membrane process for separating H_2S from natural gas, 20:23116 (R;US)

MHD Development Corp., Butte, MT (United States)
Conceptual design of a coal-fired MHD retrofit. Final technical report, 20:23742 (R;US)

Michigan State Univ., East Lansing, MI (United States)
Pressurized drift tubes scintillating fiber hadron calorimetry. Final report, 20:24351 (R;US)

Michigan Technological Univ., Houghton, MI (United States)
Visual display of reservoir parameters affecting enhanced oil recovery. FY 1994 annual report, 20:23076 (R;US)
Visual display of reservoir parameters affecting enhanced oil recovery. Quarterly report, April 1995–June 1995. 2nd Quarter, FY 1995, 20:23055 (R;US)

Michigan Univ., Ann Arbor, MI (United States)
The role of patents in technology transfer in Human Genome Project. Progress report, 20:24682 (R;US)
University of Michigan – 1994-5 performance review of D&D activities. Annual report, June 1, 1994–May 31, 1995, 20:23786 (R;US)
Wetland treatment of oil and gas well waste waters. Final report, 20:23103 (R;US)

Michigan Univ., Ann Arbor, MI (United States). Dept. of Atmospheric, Oceanic and Space Sciences
Energy transfer properties and mechanisms. Technical progress report, 20:23954 (R;US)

Michigan Univ., Ann Arbor, MI (United States). Dept. of Chemical Engineering
Wetland treatment of oil and gas well wastewaters. Quarterly technical report, May 25, 1993-August 24, 1993, 20:23102 (R;US)

Michigan Univ., Ann Arbor, MI (United States). School of Natural Resources and Environment
Changes in the flux of carbon between plants and soil microorganisms at elevated CO_2: Physiological processes with ecosystem-level implications. Progress report, [August 15, 1994–August 14, 1995], 20:24728 (R;US)

Minas Gerais Univ., Belo Horizonte, MG (Brazil). Escola de Engenharia
Design, construction and performance analysis of a compound parabolic concentrator. Simulation and experimental results, 20:23493 (I;BR;In Portugese)

Mine Safety and Health Administration, Arlington, VA (United States)
Intergas '95: International unconventional gas symposium. Proceedings, 20:23112 (R;US)

Ministerio de Industria, Energia y Mineria, Montevideo (Uruguay). Direccion Nacional de Tecnologia Nuclear
Digital simulation of an enrichment process for solutions by means of an advection-diffusion chamber, 20:24988 (I;UY;In Spanish)
Preliminary report in radiological safety for 1993 hydrology campaign, 20:24638 (I;UY;In Spanish)
Process of advective diffusive enrichment using differential gradients and the effects of variations in relaxation times, 20:23405 (I;UY;In Spanish)
Sequential method for the assessment of innovations in computer assisted industrial processes, 20:24989 (I;UY;In Spanish)
Transport process of digital simulation in hydraulic environmental engineering: direct and inverse problems analysis through an unidimensional model, 20:24987 (I;UY;In Spanish)

Ministerium fuer Umwelt, Raumordnung und Landwirtschaft des Landes Nordrhein-Westfalen, Duesseldorf (Germany)
The lower Weser river in 1993, 20:24636 (I;DE;In German)

Missouri Univ., Columbia, MO (United States)
Coal log pipeline research at the University of Missouri. 1st Quarterly report for 1995, January 1, 1995–March 31, 1995, 20:23026 (R;US)

Missouri Univ., Rolla, MO (United States)
Magnetic thin films formed in a glow discharge. Final report, 20:23778 (R;US)

Mitre Corp., McLean, VA (United States)
High integrity software for nuclear power plants: Candidate guidelines, technical basis and research needs. Executive summary: Volume 1, 20:23632 (R;US)

MK-Ferguson Co., St. Charles, MO (United States)
Weldon Spring Site Environmental Report for calendar year 1994, 20:23352 (R;US)

Mobrand Biometrics, Inc., Vashon Island, WA (United States)
Analysis of chinook salmon in the Columbia River from and ecosystem perspective. Final report, 20:23457 (R;US)

MSE, Inc., Butte, MT (United States)
Projects at the Western Environmental Technology Office. Quarterly technical progress report, January 1–March 31, 1995, 20:24577 (R;US)

Feasibility study on the environment harmony type coal utilization system. Feasibility study on the environment harmony type coal utilization system in the coal industry sector for China, 20:23022 (R;JP;In Japanese)
Report of liquid fuel conversion technology development. Feasibility survey on liquid fuel conversion, 20:23120 (R;JP;In Japanese)
Report of the fiscal 1993 liquid fuel conversion technology development. Development for Practical application of a new production process, 20:23432 (R;JP;In Japanese)
Research and development project plans for FY 1994. 1. Research and development of new energy, 20:23713 (R;JP)
Subsidies for promotion of coal production/utilization technology. First Clean Coal Technology Conference, 20:23021 (R;JP;In Japanese)
Subsidies for promotion of coal production/utilization technology. Second Clean Coal Technology (CCT) Conference, 20:22978 (R;JP;In Japanese)

New Mexico Inst. of Mining and Technology, Socorro, NM (United States)
A specialized boundary element algorithm developed to calculate the state of stress in the Anza Gap, San Jacinto Fault Zone, Southern, CA, 20:24746 (R;US)

New Mexico State Univ., Las Cruces, NM (United States)
The role of composition gradients in the evolution of uranus and neptune. Progress report, 1 January 1994–1 September 1994, 20:24755 (R;US)

New Mexico State Univ., Las Cruces, NM (United States). Dept. of Geological Sciences
Renewal: Continential lithosphere evolution as a function of tectonic environment, 20:24748 (R;US)

New York State Energy Research and Development Authority, Albany, NY (United States)
Implementation plan for the Environmental Impact Statement for completion of the West Valley Demonstration Project by the US Department of Energy and closure of the western New York Nuclear Service Center, The New York State Energy Research and Development Authority. Revision 7, 20:23325 (R;US)
Integrated process for microbial solvent production from whey permeate. Final report, 20:23427 (R;US)
Office technology energy use and savings potential in New York. Final report, 20:23758 (R;US)

North Carolina Agricultural and Technical State Univ., Greensboro, NC (United States). Dept. of Chemical Engineering
Improvement of hydrogen solubility and entrainment in hydrocracker feedstocks. Quarterly technical report, January 1, 1995–March 31, 1995, 20:23094 (R;US)

North Carolina State Univ., Raleigh, NC (United States). Dept. of Marine, Earth and Atmospheric Sciences
Shelf export of particulates/transport in continental margin waters. Final report, 20:24628 (R;US)

Notre Dame Univ., IN (United States). Dept. of Chemical Engineering
Transient studies of low temperature catalysts for methane conversion. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:22996 (R;US)

Nuclear Energy Agency, 75 - Paris (France)
Nuclear power: An overview in the context of alleviating greenhouse gas emissions, 20:23701 (R;XA)

Nuclear Regulatory Commission, King of Prussia, PA (United States). Region I
NRC TLD Direct Radiation Monitoring Network: Volume 15, No. 1. Progress report, January–March 1995, 20:24595 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering Technology
Aging of turbine drives for safety-related pumps in nuclear power plants, 20:23627 (R;US)
Effect of aging on the PWR Chemical and Volume Control System, 20:23628 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services
Indexes to Nuclear Regulatory Commission issuances, January–March 1995. Volume 41, Index 1, 20:23560 (R;US)
Nuclear Regulatory Commission issuances, March 1995. Volume 41, No. 3, 20:23561 (R;US)
Nuclear Regulatory Commission issuances, April 1995. Volume 41, Number 4, 20:23537 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Industrial and Medical Nuclear Safety
Results of regulatory impact survey of industrial and medical materials licensees of the Office of Nuclear Material Safety and Safeguards, 20:23724 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Project Support
Standard technical specifications: Babcock and Wilcox Plants. Revision 1, 20:23548 (R;US)
Standard technical specifications combustion engineering plants: Bases (Sections 2.0–3.3). Volume 2, Revision 1, 20:23541 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Reactor Controls and Human Factors
Non-Power Reactor Operator Licensing Examiner Standards. Revision 1, 20:23563 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Reactor Projects I/II
Safety evaluation report related to the operation of Watts Bar Nuclear Plant, Units 1 and 2 (Docket Nos. 50-390 and 50-391). Supplement No. 15, 20:23621 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications
Estimating boiling water reactor decommissioning costs. A user's manual for the BWR Cost Estimating Computer Program (CECP) software: Draft report for comment, 20:23633 (R;US)
Revised analyses of decommissioning for the reference boiling water reactor power station. Effects of current regulatory and other considerations on the financial assurance requirements of the decommissioning rule and on estimates of occupational radiation exposure: Main report, draft report for comment. Volume 1, 20:23630 (R;US)
Revised analyses of decommissioning for the reference boiling water reactor power station. Effects of current regulatory and other considerations on the financial assurance requirements of the decommissioning rule and on estimates of occupational radiation exposure: Appendices, draft report for comment. Volume 2, 20:23631 (R;US)
Summary of comments received at workshop on use of a Site Specific Advisory Board (SSAB) to facilitate public participation in decommissioning cases, 20:23723 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research
Nuclear Computerized Library for Assessing Reactor Reliability (NUCLARR): Data manual, Part 2: Human Error Probability (HEP) Data. Volume 5, Revision 4, 20:23575 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology
Evaluation of potential severe accidents during low power and shutdown operations at Surry, Unit 1: Evaluation of severe accident risk during mid-loop operations. Main report. Volume 6. Part 1, 20:23588 (R;US)
Evaluation of potential severe accidents during low power and shutdown operations at Surry, Unit 1: Evaluation of severe accident risk during mid-loop operations. Volume 6, Part 2: Appendices, 20:23629 (R;US)
High integrity software for nuclear power plants: Candidate guidelines, technical basis and research needs. Executive summary: Volume 1, 20:23632 (R;US)
Human factors evaluation of remote afterloading brachytherapy: Human error and critical tasks in remote afterloading brachytherapy and approaches for improved system performance. Volume 1, 20:24702 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Technical Support
Lessons learned from early implementation of the maintenance rule at nine nuclear power plants, 20:23626 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Office for Analysis and Evaluation of Operational Data
Report to Congress on abnormal occurrences, January–March 1995. Volume 18, No. 1, 20:23409 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Office of Enforcement
Enforcement actions: Significant actions resolved. Reactor licensees: Volume 14, No. 1, Part 1, Quarterly progress report January–March 1995, 20:23562 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation
Standard technical specifications: Babcock and Wilcox plants. Volume 3, Revision 1: Bases (Sections 3.4–3.9), 20:23622 (R;US)
Standard technical specifications, Westinghouse Plants: Specifications. Volume 1, Revision 1, 20:23549 (R;US)
Standard technical specifications, Westinghouse Plants: Bases (Sections 2.0–3.3). Volume 2, Revision 1, 20:23550 (R;US)
Standard technical specifications, Westinghouse Plants: Bases (Sections 3.4–3.9). Volume 3, Revision 1, 20:23551 (R;US)
Standard technical specifications: Combustion engineering plants. Volume 1, Revision 1: Specifications, 20:23623 (R;US)
Standard technical specifications: Combustion engineering plants. Volume 3, Revision 1: Bases (Sections 3.4–3.9), 20:23624 (R;US)
Standard technical specifications: General Electric plants, BWR/4. Volume 1, Revision 1: Specifications, 20:23625 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research
Proceedings of the 23rd DOE/NRC nuclear air cleaning conference, 20:23587 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Technical Training Div.
NRC's object-oriented simulator instructor station, 20:23542 (R;US)

NUS Corp., Gaithersburg, MD (United States)
Technical support services to assist the Office of Environmental Audit in conducting the DOE Environmental Survey and to provide technical assistance on Environmental Compliance issues. Technical progress report, February 16, 1990–August 13, 1990, 20:24572 (R;US)
Technical support services to assist the Office of Environmental Audit in conducting the DOE Environmental Survey and to provide technical assistance on Environmental Compliance issues. Technical progress report, August 14, 1990–February 15, 1991, 20:24573 (R;US)

O

Oak Ridge Associated Universities, Inc., TN (United States)
18th Annual TRADE Conference: Abstracts, 20:24931 (R;US)
Nanoindentation and nanoscratching of hard carbon coatings for magnetic disks, 20:23906 (R;US)

Oak Ridge Inst. for Science and Education, TN (United States)
Adjusting external doses from the ORNL and Y-12 facilities for the Oak Ridge Nuclear Facilities mortality study, 20:24724 (R;US)
Data collection, validation, and description for the Oak Ridge nuclear facilities mortality study, 20:23362 (R;US)
Health physics/radiation protection enrollments and degrees, 1994: Appendixes, 20:24701 (R;US)
Manpower assessment brief: June 1995, No. 29, 20:23682 (R;US)
Manpower assessment brief: May 1995, No. 31, 20:24700 (R;US)

Oak Ridge Inst. for Science and Education, TN (United States). Medical Sciences Div.
Oak Ridge Institute for Science and Education, Medical Sciences Division report for 1994, 20:24725 (R;US)

Oak Ridge K-25 Site, TN (United States)
IAEA workshop and field trial at the Oak Ridge K-25 Site, 20:24590 (R;US)

Oak Ridge National Lab., TN (United States)

A CMOS integrated circuit for pulse-shaped discrimination, 20:24033 (R;US)

A facility design for repackaging ORNL CH-TRU legacy waste in Building 3525, 20:23223 (R;US)

A flexible analog memory address list manager/controller for PHENIX, 20:24348 (R;US)

A note on seven analogous properties between Stirling numbers of the first kind and binomial coefficients, 20:25001 (R;US)

A restricted branch and bound approach for setting the left turn phase sequences in signalized networks, 20:23764 (R;US)

A small graphite-reflected UO_2 assembly, 20:23594 (R;US)

Additional verification problems for HEATING 7.2, 20:25000 (R;US)

Advanced computational research in materials processing for design and manufacturing, 20:23817 (R;US)

Adventures in Supercomputing: An innovative program, 20:24924 (R;US)

Aging of turbine drives for safety-related pumps in nuclear power plants, 20:23627 (R;US)

Amorphous diamond-like carbon film growth by KrF- and ArF- excimer laser PLD: Correlation with plume properties, 20:23907 (R;US)

An integrated model for optimizing weld quality, 20:23850 (R;US)

An MPI version of the BLACS, 20:24977 (R;US)

Application of damage models in metal forming, 20:23845 (R;US)

Application of the TRUEX process to highly irradiated targets, 20:23217 (R;US)

Assays and screening of alpha contaminated soils using low-resolution alpha spectroscopy of thick soil samples, 20:24564 (R;US)

Assessment of the roles of the Advanced Neutron Source Operators, 20:23408 (R;US)

Batch test equilibration studies examining the removal of Cs, Sr, and Tc from supernatants from ORNL underground storage tanks by selected ion exchangers, 20:23941 (R;US)

Biological tracer for waste site characterization, 20:23316 (R;US)

Branches on the family tree: Superconductivity in epitaxial films of "first-in-line" descendants of the parent compound $SrCuO_2$, 20:23888 (R;US)

Calculated in-air leakage spectra and power levels for the ANSI standard minimum accident of concern. Final report, 20:23130 (R;US)

Ceramic composites with a ductile Ni_3Al binder phase, 20:23904 (R;US)

Characterization of residual stresses in graded ceramic-metal structures: A comparison of diffraction experiments and FEM calculations, 20:23903 (R;US)

Cloud cover and type over the former USSR, 1936-83; trends derived from the RIHMI-WDC 223-station 6- and 3-hourly meteorological database, 20:24529 (R;US)

Coherent infrared imaging camera (CIRIC), 20:24380 (R;US)

Collisional effects of background gases on pulsed laser deposition plasma beams, 20:23841 (R;US)

Controlling cycle-by-cycle variation in a pulse combustor, 20:24030 (R;US)

Criticality safety studies of Building 3019 Cell 4 and in-line storage wells, 20:23992 (R;US)

Decision-making in demand-side management collaboratives: The influence of non-utility parties on electric-utility policies and programs, 20:23728 (R;US)

Defining the next generation munitions handler, 20:24409 (R;US)

Design and testing of integrated circuits for reactor protection channels, 20:23614 (R;US)

Detailed flux calculations for the conceptual design of the Advanced Neutron Source Reactor, 20:23605 (R;US)

Detailed heat load calculations at the beginning, middle, and end of cycle for the conceptual design of the Advanced Neutron Source Reactor, 20:23606 (R;US)

Energy-filtered imaging of precipitates in FeCuN alloys, 20:23848 (R;US)

Energy-filtered plasmon images of $MgAl_2O_4$ implanted with Al^+ and Mg^+ ions, 20:24884 (R;US)

Environmental assessment and social justice, 20:23219 (R;US)

Environmental resources of selected areas of Hawaii: Climate, ambient air quality, and noise, 20:24546 (R;US)

Environmental resources of selected areas of Hawaii: Ecological resources, 20:23496 (R;US)

Estimation of contaminant transport in groundwater beneath radioactive waste disposal facilities, 20:24566 (R;US)

Evaluating the income and employment impacts of gas cooling technologies, 20:23759 (R;US)

Evaluation of density separation and other treatment methods for plastic media blasting (PMB) waste, 20:23795 (R;US)

Evaluation of selected ion exchangers for the removal of cesium from MVST W-25 supernate, 20:23221 (R;US)

Experimentally determined profiles of fast wave current drive on DIII-D, 20:24864 (R;US)

Fast wave current drive modeling using the combined RANT3D and PICES codes, 20:24859 (R;US)

Fracture behavior of Cr_2Nb-based intermetallics, 20:23837 (R;US)

From public participation to stakeholder involvement: The rocky road to more inclusiveness, 20:23690 (R;US)

GELCASTING: From laboratory development toward industrial production, 20:23887 (R;US)

Growth and properties of $PbTiO_3$/PLT heterostructures, 20:23884 (R;US)

Heavy-Section Steel Irradiation Program on irradiation effects in light-water reactor pressure vessel materials, 20:23847 (R;US)

High resolution airborne geophysics at hazardous waste disposal sites, 20:24565 (R;US)

High Temperature Materials Laboratory seventh annual report, October 1993–September 1994, 20:23714 (R;US)

High-temperature corrosion behavior of iron-aluminide alloys and coatings, 20:23844 (R;US)

HRB-22 preirradiation thermal analysis, 20:23604 (R;US)

Hydrogen fuel dispensing station for transportation vehicles, 20:23819 (R;US)

Impact of organic-mineral matter interactions on thermal reaction pathways for coal model compounds, 20:22983 (R;US)

In situ techniques for the characterization and monitoring of a radioactively contaminated site for in situ vitrification, 20:23177 (R;US)

Incorporating environmental justice into environmental decision making, 20:23676 (R;US)

Independent verification of reprocessing input and process volumes. Progress report, 20:23387 (R;US)

Instrumentation and Controls Division Progress report, July 1, 1992–June 30, 1994, 20:23991 (R;US)

Interim report on intrathoracic radiotherapy of human small-cell lung carcinoma in nude mice with Re-188-RC-160, a radiolabeled somatostatin analogue, 20:24699 (R;US)

Investigation of optical loss mechanisms in oxide thin films, 20:23905 (R;US)

Laser-solid interaction and dynamics of the laser-ablated materials, 20:23842 (R;US)

Levelized cost-benefit analysis of proposed diagnostics for the Ammunition Transfer Arm of the US Army's Future Armored Resupply Vehicle, 20:24408 (R;US)

Ligands for SPECT and PET imaging of muscarinic-cholinergic receptors of the heart and brain, 20:24698 (R;US)

Liquid and Gaseous Waste Operations Department annual operating report CY 1994, 20:23218 (R;US)

Long-term testing, 20:23885 (R;US)

Mechanistic modeling of high-temperature ordered intermetallics, 20:23846 (R;US)

Microanalysis at atomic resolution, 20:24026 (R;US)

Nanoindentation and nanoscratching of hard carbon coatings for magnetic disks, 20:23906 (R;US)

New glass material oxidation and dissolution system facility: Direct conversion of surplus fissile materials, spent nuclear fuel, and other material to high-level-waste glass. Storage and disposition of weapons-usable fissile materials programmatic environmental impact statement data report: Predecisional draft, 20:23386 (R;US)

New insights into input relegation control for inverse kinematics of a redundant manipulator. Part 2, The optimization of a secondary criteria involving self motion of the joints, 20:23994 (R;US)

Non-conventional passive sensors for monitoring tritium on surfaces, 20:24347 (R;US)
Nuclear medicine program progress report for quarter ending March 31, 1995, 20:24703 (R;US)
Numerical predictions of the separation of heavy components inside the trace gas concentrator, 20:23942 (R;US)
Oak Ridge Reservation Waste Management Plan, 20:23192 (R;US)
Pack cementation diffusion coatings for iron-base alloys, 20:23865 (R;US)
Panama Canal capacity analysis, 20:23765 (R;US)
Performance of pancake coils of parallel co-wound Ag/BSCCO tape conductors in static and ramped magnetic fields, 20:24856 (R;US)
Phase transformations and microstructure development in low alloy steel welds, 20:23849 (R;US)
Post-radiation memory correction using differential subtraction for Phenix, 20:24349 (R;US)
Potential supply and cost of biomass from energy crops in the TVA region, 20:23431 (R;US)
Prediction of external corrosion for UF_6 cylinders: Results of an empirical method, 20:23150 (R;US)
Prediction of parallel NIKE3D performance on the KSR1 system, 20:23993 (R;US)
Preliminary remediation goals for use at the U.S. Department of Energy Oak Ridge Operations Office, 20:23356 (R;US)
Prevention of non-ductile fracture in 6061-T6 aluminum nuclear pressure vessels, 20:23593 (R;US)
Production and mitigation of acid chlorides in geothermal steam, 20:23498 (R;US)
Production costs and supply of biomass by U.S. Region, 20:23430 (R;US)
Project management plan for the Isotopes Facilities Deactivation Project at Oak Ridge National Laboratory. Environmental Restoration Program, 20:23410 (R;US)
Prospects and status of low-aspect-ratio tokamaks, 20:24883 (R;US)
Prospects for Tokamak Fusion Reactors, 20:24885 (R;US)
Radioactive and mixed waste - risk as a basis for waste classification. Symposium proceedings No. 2, 20:23215 (R;US)
Radiological survey results at 914 Black Oak Ridge Road, Wayne, New Jersey (WJ005), 20:24601 (R;US)
Radiological verification survey results at the Pompton Plains Railroad Spur, Pequannock, New Jersey (PJ008V), 20:24602 (R;US)
Radiological verification survey results at 15 Peck Ave., Pequannock, New Jersey (PJ005V), 20:24603 (R;US)
Radiological verification survey results at 14 Peck Ave., Pequannock, New Jersey (PJ001V), 20:23364 (R;US)
Radiological verification survey results at 3 Peck Ave., Pequannock, New Jersey (PJ002V), 20:24596 (R;US)
Radiological verification survey results at 7 Peck Ave., Pequannock, New Jersey (PJ003V), 20:24597 (R;US)
Radiological verification survey results as 13 Peck Ave., Pequannock, New Jersey (PJ004V), 20:24598 (R;US)
Radiological verification survey results at 17 Peck Ave., Pequannock, New Jersey (PJ006V), 20:24599 (R;US)
Radiological verification survey results at 898 Black Oak Ridge Rd., Wayne, New Jersey (WJ004V), 20:24600 (R;US)
Readiness review plan for the in situ vitrification demonstration of Seepage Pit 1 in Waste Area Grouping 7, 20:23216 (R;US)
Real-time chemical analysis of aerosol particles, 20:24528 (R;US)
Removal of technetium from alkaline nuclear-waste media by a solvent-extraction process using crown ethers, 20:23175 (R;US)
Research and institutional dimensions of environmental justice: Implications for NEPA documentation, 20:23689 (R;US)
Resonant soft x-ray fluorescence studies of novel materials, 20:23897 (R;US)
Results of the supplementary radiological survey at the former C. H. Schnoor and Company site, 644 Garfield Street, Springdale, Pennsylvania (CVP001), 20:23363 (R;US)
Robotic conveyance of artillery projectiles for remote ammunition resupply operations, 20:24407 (R;US)

Phase II – Photovoltaics for Utility Scale Applications (PVUSA). Progress report, 20:23482 (R;US)
Photovoltaic balance-of-system designs and costs at PVUSA, 20:23481 (R;US)
The value of distributed generation: The PVUSA grid-support project serving Kerman Substation. Interim report, April 1994, 20:23654 (R;US)

Pacific Northwest Lab., Richland, WA (United States)
A PC-based software package for modeling DOE mixed-waste management options, 20:23232 (R;US)
A programmable Fortran preprocessor, 20:25005 (R;US)
A simple method of estimating wind turbine blade fatigue at potential wind turbine sites, 20:23511 (R;US)
A tool for promoting pollution prevention in facility design, 20:25004 (R;US)
A variety of neutron sensors based on scintillating glass waveguides, 20:24372 (R;US)
Accelerated aging studies and environmental stability of prototype tamper tapes, 20:23921 (R;US)
Adaptive life simulator: A novel approach to modeling the cardiovascular system, 20:24708 (R;US)
Ammonia and ammonium hydroxide sensors for ammonia/water absorption machines: Literature review and data compilation, 20:23796 (R;US)
Analysis of organic carbon and moisture in Hanford single-shell tank waste, 20:23225 (R;US)
Application of macro material flow modeling to the decision making process for integrated waste management systems, 20:23236 (R;US)
Assessment of Critical Mass Laboratory safeguards and security upgrades, 20:23389 (R;US)
Basic visual observation skills training course. Final report, 20:23391 (R;US)
Basic visual observation skills training course: Appendix A. Final report, 20:23392 (R;US)
Basic visual observation skills training course: Appendix B. Final report, 20:23393 (R;US)
Bench-scale/field-scale interpretations: Session overview, 20:24705 (R;US)
Chemical analysis of biomass fast pyrolysis oils, 20:23429 (R;US)
Deploying in situ bioremediation at the Hanford Site, 20:23366 (R;US)
Destruction of chlorofluorocarbons and halons, 20:23706 (R;US)
Development of a flexible thermosyphon for cooling a concentrated heat source, 20:23998 (R;US)
Ecological evaluation of proposed dredged material from Richmond Harbor Deepening Project and the intensive study of the Turning Basin, 20:24639 (R;US)
Effect of temperature on perchloroethylene dechlorination by a methanogenic consortium, 20:24607 (R;US)
Enterprise wide transparent information access, 20:23235 (R;US)
Extrapolation of creep behavior of high-density polyethylene liner in the Catch Basin of grout vaults, 20:23224 (R;US)
Federal, state and utility roles in reducing new building greenhouse gas emissions, 20:23703 (R;US)
FORSCOM installation characterization and ranking for water efficiency improvement, 20:23761 (R;US)
Geologic, geochemical, microbiologic, and hydrologic characterization at the In Situ Redox Manipulation Test Site, 20:24606 (R;US)
Global arrays: A portable "shared-memory" programming model for distributed memory computers, 20:25003 (R;US)
Hanford 300 Area steam transition preliminary utility options study, 20:23807 (R;US)
Hanford high level waste: Sample Exchange/Evaluation (SEE) Program, 20:23230 (R;US)
Hanford radiological protection support services annual report for 1994, 20:24726 (R;US)
Hanford stakeholder participation in evaluating innovative technologies: VOC product line, Passive soil vapor extraction using borehole flux tunable hybrid plasma, 20:23227 (R;US)
High-temperature superconducting transformer evaluation, 20:23658 (R;US)
Human-computer interface design, 20:25006 (R;US)
Identification of physical properties for the retrieval data quality objective process, 20:23365 (R;US)
Impact assessment of additional safeguards and security controls on selected nuclides, 20:23388 (R;US)
In situ MeV ion beam analysis of ceramic surfaces modified by 100-400 keV ion irradiation, 20:23896 (R;US)
Inorganic ion exchange evaluation and design: Silicotitanate ion exchange waste conversion, 20:23226 (R;US)
Large-area fiber-optic chemical sensors, 20:24389 (R;US)
Long-term performance of glasses for Hanford low-level waste, 20:23161 (R;US)
Maintaining the solution to operations and maintenance efficiency improvement, 20:23762 (R;US)
Measurement of polynuclear aromatic hydrocarbon concentrations in the plume of Kuwait oil well fires, 20:23107 (R;US)

Micro-manipulator motion control to suppress macro-manipulator structural vibrations, 20:23999 (R;US)
Modeling biologically reactive transport in porous media, 20:24609 (R;US)
Optimization of waste loading in high-level glass in the presence of uncertainty, 20:23231 (R;US)
Pacific Northwest Laboratory annual report for 1994 to the DOE Office of Energy Research. Part 2: Atmospheric and climate research, 20:24547 (R;US)
Pacific Northwest Laboratory CALIOPE overview, 20:24390 (R;US)
Processing & properties $La_{1-x}A_xCo_{1-y}Fe_yO_3$(A = Sr, Ca) perovskites, 20:23895 (R;US)
Prognostic atmospheric and dispersion modeling in the vicinity of Rocky Flats Plant, 20:24548 (R;US)
Quest for quality informal proceedings of the first Hanford Site Technical Communications Seminar, 20:25029 (R;US)
Radical production in biological systems, 20:24727 (R;US)
Results of regulatory impact survey of industrial and medical materials licensees of the Office of Nuclear Material Safety and Safeguards, 20:23724 (R;US)
Revised analyses of decommissioning for the reference boiling water reactor power station. Effects of current regulatory and other considerations on the financial assurance requirements of the decommissioning rule and on estimates of occupational radiation exposure: Appendices, draft report for comment. Volume 2, 20:23631 (R;US)
Risk information in support of cost estimates for the Baseline Environmental Management Report (BEMR). Section 1, 20:24605 (R;US)
Solar semidiurnal tidal wind oscillations above the CART site, 20:24549 (R;US)
Storage of LWR spent fuel in air. Volume 3, Results from exposure of spent fuel to fluorine-contaminated air, 20:23229 (R;US)
Structure sensitive selectivity of the NO-CO reaction over rhodium single crystal catalysts, 20:23964 (R;US)
Tamper tape seals, 20:23390 (R;US)
Tank Waste Remediation System Guide, 20:23228 (R;US)
TEDANN: Turbine engine diagnostic artificial neural network, 20:23997 (R;US)
TEMPEST: A computer code for three-dimensional analysis of transient fluid dynamics, 20:25002 (R;US)
The AMTEX Partnership. Second quarter report, Fiscal Year 1995, 20:23715 (R;US)
The development and usage of a new chemical transport code: AREST-CT, 20:23331 (R;US)
The framework and tools for the Western Area Power Administration's Environmental Risk Management Program, 20:23663 (R;US)
The use of bench- and field-scale data for design of an in situ carbon tetrachloride bioremediation system, 20:24608 (R;US)
The value added of conducting regional versus local stakeholder involvement in evaluating technology acceptance, 20:23704 (R;US)
Tritium radioluminescent devices, Health and Safety Manual, 20:23411 (R;US)
Use of GIS in the Federal Emergency Management Information System (FEMIS), 20:25007 (R;US)
Using new replication features of Oracle 7 in emergency management system, 20:23705 (R;US)
Vitrification development for mixed wastes, 20:23233 (R;US)
Waste forms based on Cs-loaded silicotitanates, 20:23234 (R;US)
Waste reduction using carbon dioxide: A solvent substitute for precision cleaning applications, 20:23797 (R;US)
Why so few young women in mathematics, science, and technology classes?, 20:23683 (R;US)

Pacific Science and Engineering Group, San Diego, CA (United States)
Human factors evaluation of remote afterloading brachytherapy: Human error and critical tasks in remote afterloading brachytherapy and approaches for improved system performance. Volume 1, 20:24702 (R;US)

Paul Scherrer Inst. (PSI), Villigen (Switzerland). Dept. F3B Applied Solid State Physics
Paul Scherrer Institut annual report 1994. Annex III B: PSI applied solid state physics, 20:23471 (I;CH)

Pennsylvania State Univ., University Park, PA (United States)
A study of NO_x reduction by fuel injection recirculation. Topical report, January 1995–May 1995, 20:23127 (R;US)
An experimental and theoretical study to relate uncommon rock/fluid properties to oil recovery. Final report, 20:23070 (R;US)
Micro-agglomerate flotation for deep cleaning of coal. Quarterly progress report, January 1, 1995–March 31, 1995, 20:22981 (R;US)
Oil production enhancement through a standardized brine treatment. Final report, 20:23101 (R;US)

Pennsylvania State Univ., University Park, PA (United States). Coll. of Earth and Mineral Sciences
Advanced thermally stable jet fuels. Technical progress report, April 1994–June 1994, 20:23002 (R;US)
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Final technical report, October 1990–December 1994, 20:22988 (R;US)

Pennsylvania State Univ., University Park, PA (United States). Dept. of Materials Science and Engineering
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, October–December 1993, 20:22987 (R;US)

Pennsylvania State Univ., University Park, PA (United States). Dept. of Physics
Theoretical studies in high energy nuclear physics. Progress report, 20:24787 (R;US)

Pennsylvania State Univ., University Park, PA (United States). Energy and Fuels Research Center
Coal-water slurry fuel combustion testing in an oil-fired industrial boiler. Semiannual technical progress report, August 15, 1994–February 15, 1995, 20:23034 (R;US)

Pernambuco Univ., Recife, PE (Brazil). Dept. de Energia Nuclear
Numerical simulation of photovoltaic power plant interconnected to a grid of electric energy, 20:23483 (I;BR;In Portugese)
Small scale irrigation system using a CEC photovoltaic generator. Technical and economic analysis, 20:23484 (I;BR;In Portugese)
Utilization of solar energy in the industry of ceramics for the drying process, 20:23490 (I;BR;In Portugese)

Petroleum Consulting Services, Canton, OH (United States)
Liquid-free CO_2/sand fracturing in low-permeability reservoirs, 20:23114 (R;US)

Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering
Low severity upgrading of F-T waxes with solid superacids. Quarterly report, January 1995–March 1995, 20:22991 (R;US)

Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil). Dept. de Informatica
An expert system for the identification and quantification of energy interchange modalities, 20:23638 (I;BR;In Portugese)

Prairie View A and M Univ., TX (United States)
Combustion characterization of coal fines recovered from the handling plant. Quarterly technical progress report No. 2, January 1, 1995–March 31, 1995, 20:23042 (R;US)

Princeton Univ., NJ (United States)
Direct current sputtering of boron from boron/carbon mixtures, 20:24905 (PA;US)

Princeton Univ., NJ (United States). Plasma Physics Lab.
Alfven cyclotron instability and ion cyclotron emission, 20:24875 (R;US)
Collisional stochastic ripple diffusion of alpha particles and beam ions on TFTR, 20:24874 (R;US)
Enhanced loss of fusion products during mode conversion heating in TFTR, 20:24876 (R;US)
Experimental study of toroidicity-induced Alfven eigenmode (TAE) stability at high q(0), 20:24877 (R;US)

Purdue Univ., Lafayette, IN (United States)
Numerical calculation of two-phase turbulent jets, 20:24021 (R;US)

Purdue Univ., Lafayette, IN (United States). School of Electrical Engineering
Numerical modeling of the temperature illumination intensity dependent performance of CIS solar cells, 20:23466 (R;US)
Numericl modeling of graded band gap CIGS solar cells, 20:23467 (R;US)

R

Radian Corp., Austin, TX (United States)
High SO_2 removal efficiency testing, 20:23522 (R;US)
Reed Coll., Portland, OR (United States)
Reed Reactor Facility. Final report, 20:23596 (R;US)
Rensselaer Polytechnic Inst., Troy, NY (United States)
Development and use of image scanning ellipsometer to study the dynamics of heated thin liquid films. Progress report, July 1, 1989–December 31, 1994, 20:24020 (R;US)
Resource Technology Corp., Laramie, WY (United States)
Evaluation of the freeze-thaw/evaporation process for the treatment of produced waters. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:23104 (R;US)
Resources for the Future, Inc., Washington, DC (United States). Dept. of Energy and Natural Resources
Assessing the impacts of climate change on natural resource systems, 20:24576 (R;US)
Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States)
Qualitative validation of emergency response procedures, 20:24934 (R;US)
Rice Univ., Houston, TX (United States)
Characterization of oil and gas waste disposal practices and assessment of treatment costs. Final report, 20:23092 (R;US)
Rice Univ., Houston, TX (United States). Dept. of Chemistry
Infrared absorption spectroscopy and chemical kinetics of free radicals. Final performance report, August 1, 1985–July 31, 1994, 20:23953 (R;US)
Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy
A comment on the future studies on classical hot atom chemistry, 20:23972 (RA;JP)
Rochester Univ., NY (United States). Lab. for Laser Energetics
LLE review. Volume 61, Quarterly report, October–December 1994, 20:24858 (R;US)
Rockwell International Corp., Golden, CO (United States)
Removal of radioactive materials and heavy metals form water using magnetic resin, 20:24604 (PA;US)
Rocky Flats Environmental Technology Site, Golden, CO (United States)
Summary report of incineration plenum fire: Building 771, July 2, 1980, 20:23367 (R;US)
Ruhrkohle AG, Essen (Germany)
Branch project mining industry: Development of a system for epidemiological analyses in the occupational medicine (SEPIA). Appendix. SEPIA-AMD manual. Final report, 20:23049 (R;DE;In German)
Russian Federal Nuclear Center (Russian Federation)
Final report task order number B239641 between the Regents of the University of California and Institute of Experimental Physics task 2: Switch development., 20:24908 (R;US)

S

Saarbergwerke AG, Saarbruecken (Germany). Produktbereich Zentrale Dienste
Environmentally friendly flexible drive concept for hard coal mining. Final report, 20:23023 (I;DE;In German)
Safe Sites of Colorado, Golden, CO (United States)
Nondestructive assay (NDA) of fissile material solutions in tanks at Rocky Flats Environmental Technology Site, 20:23394 (R;US)
Sandia Labs., Albuquerque, NM (United States)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 6: Appendix GCR Volume 1, 20:23319 (R;US)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 7: Appendix GCR Volume 2, 20:23320 (R;US)
Sandia National Labs., Albuquerque, NM (United States)
1994 Ergonomics Program Quality Evaluation, 20:24945 (R;US)
A Long-Range Video Observation Post, 20:23396 (R;US)
A nightly conditioning method to reduce parasitic power consumption in molten-salt central-receiver solar-power plants, 20:23489 (R;US)
A numerical model of 2-D sloshing of pseudo-viscous liquids in horizontally accelerated rectangular containers, 20:24023 (R;US)
A one piece wall box for space electronics, 20:24043 (R;US)
A proposed methodology for computational fluid dynamics code verification, calibration, and validation, 20:24022 (R;US)
A survey of environmental needs and innovative technologies in Germany, 20:23717 (R;US)
A systems configuration toolkit for modular integration of mechatronic resources, 20:25033 (R;US)
Adjoint ITS calculations using the CEPXS electron-photon cross sections, 20:24832 (R;US)
Aging assessment for active fire protection systems, 20:23636 (R;US)
An optically-triggered semiconductor switch for high power laser beams, 20:24042 (R;US)
An overview of semiconductor bridge, SCB, applications at Sandia National Laboratories, 20:24416 (R;US)
Application of optimization to the inverse problem of finding the worst-case heating configuration in a fire, 20:24432 (R;US)
Applications of microstructural modeling, 20:23867 (R;US)
Assembly sequencing with toleranced parts, 20:25008 (R;US)
Autoignition of hydrogen under direct-injection compression-ignition engine conditions, 20:23810 (R;US)
Boltzmann-equation simulations of radio-frequency-driven, low-temperature plasmas, 20:24769 (R;US)
Bridged polysilsesquioxane xerogels: A molecular based approach for the preparation of porous hybrid organic-inorganic materials, 20:23926 (R;US)
Building 891 hazards assessment document, 20:23370 (R;US)
Coal char fragmentation during pulverized coal combustion, 20:23044 (R;US)
Coal combustion science. Quarterly progress report, April 1994–June 1994, 20:23045 (R;US)
Command shaping for residual vibration free crane maneuvers, 20:24002 (R;US)
Communicating in a multi-project environment with a single-sheet project plan, 20:24944 (R;US)
Composition analysis of ECR-grown SiO_2 and SiO_xF_y films, 20:24046 (R;US)
Computational analysis of a three-dimensional High-Velocity Oxygen-Fuel (HVOF) Thermal Spray torch, 20:24031 (R;US)
Computer modeling of electrical performance of detonators, 20:24431 (R;US)
CONTAIN code analyses of direct containment heating (DCH) experiments, 20:23634 (R;US)
CONTAIN code analyses of direct containment heating (DCH) experiments: Model assessment and phenomenological interpretation, 20:23635 (R;US)
Creep in Topopah Spring Member welded tuff. Yucca Mountain Site Characterization Project, 20:23332 (R;US)
Crisis prevention centers as confidence building measures: Suggestions for Northeast Asia, 20:23684 (R;US)
Current status and future research in motion planning, 20:24003 (R;US)
Damage evolution in metal matrix composites subjected to thermomechanical fatigue, 20:23924 (R;US)
Deformation study of separator pellets for thermal batteries, 20:23668 (R;US)
Design, fabrication, and testing of a sodium evaporator for the STM4-120 kinematic Stirling engine, 20:23488 (R;US)
Detailed characterization and preliminary adsorption model for materials for an intermediate-scale reactive-transport experiment, 20:24610 (R;US)
Determination of modal residues and residual flexibility for time-domain system realization, 20:24001 (R;US)
Diffusion in polycrystalline microstructures, 20:23927 (R;US)
Effects of pre-stressing and flux on the flow of solder on PWB copper surfaces, 20:24041 (R;US)
Electrophoretically-deposited solid film lubricants, 20:23922 (R;US)
Energy dispersive X-ray reflectivity characterization of semiconductor heterostructures and interfaces, 20:24852 (R;US)

Evaluation of commercially available exterior digital VMDs, 20:24410 (R;US)
Formulation and numerical analysis of nonisothermal multiphase flow in porous media, 20:23237 (R;US)
Fullerene-based materials research and development. LDRD final report, 20:23965 (R;US)
Further development of the ion cross section for single event upset: model (HICUP), 20:24827 (R;US)
Geotechnical characterization of the North Ramp of the Exploratory Studies Facility: Yucca Mountain Site Characterization Project. Volume 1, Data summary, 20:23238 (R;US)
Geotechnical characterization of the North Ramp of the Exploratory Studies Facility: Yucca Mountain Site Characterization Project. Volume 2, NRG corehole data appendices, 20:23239 (R;US)
Geotechnology for low-permeability gas reservoirs, 1995, 20:23111 (R;US)
Hanford coring bit temperature monitor development testing results report, 20:23241 (R;US)
High quality actively cooled plasma facing components for fusion, 20:24906 (R;US)
High rate ECR etching of III-V nitride materials, 20:23923 (R;US)
High shock, high frequency characteristics of a mechanical isolator for a piezoresistive accelerometer, 20:24004 (R;US)
High-power electron-beam transport in long gas cells from 10^{-3} to 10^{3} Torr nitrogen, 20:24142 (R;US)
Human factors in agile manufacturing, 20:24929 (R;US)
Hydrotreating of coal-derived liquids, 20:23000 (R;US)
Identification of remediation needs and technology development focus areas for the Environmental Restoration (ER) Project at Sandia National Laboratories/New Mexico (SNL/NM), 20:23369 (R;US)
Intra-site Secure Transport Vehicle test and evaluation, 20:23397 (R;US)
Investigations of emergency destruction methods for recovered, explosively configured, chemical warfare munitions: Interim emergency destruction methods - evaluation report, 20:24419 (R;US)
ITEP: A survey of innovative environmental restoration technologies in the Netherlands and France, 20:23716 (R;US)
ITS Version 4.0: Electron/photon Monte Carlo transport codes, 20:24831 (R;US)
$La_{0.5}Sr_{0.5}CoO_3$ electrode technology for Pb(Zr, Ti)O_3 thin film nonvolatile memories, 20:24045 (R;US)
Measures of effectiveness for BMD mid-course tracking on MIMD massively parallel computers, 20:24435 (R;US)
Modeling of capillary barriers and comparison to data, 20:24611 (R;US)
Monitoring of MOCVD reactants by UV absorption, 20:23866 (R;US)
Motion planning for multiple moving objects, 20:24000 (R;US)
Multicomponent three-phase equilibria, 20:23966 (R;US)
Notes from a quarter century behind a green curtain, 20:23685 (R;US)
Observations of the boiling process from a downward-facing torispherical surface: Confirmatory testing of the heavy water new production reactor flooded cavity design, 20:23607 (R;US)
On-line controlled documents: Lessons learned, 20:25031 (R;US)
Origin, diagnostics, and mitigation of a salt dissolution sinkhole at the US Strategic Petroleum Reserve storage site, Weeks Island, Louisiana, 20:23067 (R;US)
Overview of criminal justice projects at Sandia National Laboratories, 20:23398 (R;US)
P2 performance measurement tools workbook: Draft, 20:23242 (R;US)
Passive safety concepts applied to critical functions, 20:24740 (R;US)
Passive soil venting at the Chemical Waste Landfill Site at Sandia National Laboratories, Albuquerque, New Mexico, 20:23240 (R;US)
Phosphors for flat panel emissive displays, 20:24391 (R;US)
Polyelectrolyte gels, 20:23929 (R;US)
Power of a shared vision, 20:24946 (R;US)
Progress toward using hydraulic data to diagnose lost circulation zones, 20:23497 (R;US)
Release of inorganic material during coal devolatilization. Milestone report, 20:23046 (R;US)
Reliable motion detection of small targets in video with low signal-to-clutter ratios, 20:23395 (R;US)
Research methods to develop measures of effectiveness of the United States Coast Guard's Vessel Inspection and Boarding Program, Volume 1 - executive summary, 20:24941 (R;US)
Research methods to develop Measures of Effectiveness of the United States Coast Guard's Vessel Inspection and Boarding Program. Volume 2, Main report, 20:23768 (R;US)
Sandia National Laboratories (SNL) and Oak Ridge National Laboratories (ORNL) joint development of SNL's sample tracking, analysis and reporting (STAR) information system, 20:25032 (R;US)
SANDOSE. Sandia Total Dose Estimator Using Mass Sectoring of 3-D CAD Models, 20:24982 (CM;US)
Selecting a risk-based tool to aid in decision making, 20:24942 (R;US)
Semiempirical study of hydrogen addition to single-walled carbon nanotubes, 20:23928 (R;US)
SERAPHIM: A propulsion technology for fast trains, 20:23815 (R;US)
Straight-Line: A nuclear material storage information management system, 20:23400 (R;US)
Style, content and format guide for writing safety analysis documents: Volume 2, Safety assessment reports for DOE nonnuclear facilities, 20:23707 (R;US)
The development of a walk-through portal detector for the identification of contraband explosives, 20:23399 (R;US)
The emerging roles of energy storage in a competitive power market: Summary of a DOE Workshop, 20:23664 (R;US)
The expanded role of software in a control system, 20:24005 (R;US)
The pulsed linear induction motor concept for high-speed trains, 20:23770 (R;US)
The state-of-the-art port of entry workshop, 20:23769 (R;US)
The vital issues process: Strategic planning for a changing world, 20:24943 (R;US)
Thermal batteries: A technology review and future directions, 20:23669 (R;US)
Transformer design considerations for non-continuous mode, boost, flyback converters, 20:24044 (R;US)
Trapping of radiation in plasmas, 20:24849 (R;US)
User-driven product data manager system design, 20:25030 (R;US)
Velocity boundary conditions for vorticity formulations of the incompressible Navier-Stokes equations, 20:24770 (R;US)
Yield strength and stress relaxation data for an adhesive used in butt joint tests, 20:23925 (R;US)

Sandia National Labs., Livermore, CA (United States)

A conservative Low Mach number projection method for reacting flow modelling, 20:23973 (R;US)
A model of phase transformation plasticity, 20:23869 (R;US)
Analysis of buckling distortion in bead-on-plate Ti 6-4 welds, 20:23871 (R;US)
Asynchronous global optimization techniques for medium and large inversion problems, 20:24749 (R;US)
Cryocycling of energetic materials: Status report for FY94, 20:24418 (R;US)
Extreme Ultraviolet Lithography with laser plasma sources, 20:24047 (R;US)
Gas-phase chemistry during the conversion of cyclohexane to carbon: Flow reactor studies at low and intermediate pressure, 20:23967 (R;US)
Modeling the segregation of hydrogen to lattice defects in nickel, 20:23868 (R;US)
Particle size reduction of propellants by cryocycling, 20:24417 (R;US)
Sandia Combustion Research: Technical review, 20:23974 (R;US)
Temperature-dependent structure of $\mathbf{a}(10\bar{1})$ superdislocations in Ni_3Al, 20:23870 (R;US)
The release of iron during coal combustion. Milestone report, 20:23043 (R;US)

Santa Catarina Univ., Florianopolis, SC (Brazil). Programa de Pos-graduacao em Engenharia Eletrica
Dynamic preventive control in electric power systems, 20:23642 (I;BR;In Portugese)
Hierarchical state estimation for interconnected electric power systems: a comparative analysis, 20:23656 (I;BR;In Portugese)
Long term planning for expansion of electric energy transmission systems with restriction of transient stability using the concept of potential energy boundary surface, 20:23643 (I;BR;In Portugese)

Sao Paulo Univ., Sao Carlos, SP (Brazil). Inst. de Fisica e Quimica
Study of the characteristics of single crystal silicon solar cells, 20:23470 (I;BR;In Portugese)

Savannah River Ecology Lab., Aiken, SC (United States)
STResS (Simulated Toxicant-Related Stress) documentation, 20:24737 (R;US)
UnCensor© v4.0, 20:25010 (R;US)

Science Applications International Corp., Las Vegas, NV (United States)
Continuous, environmental radon monitoring program at the Yucca Mountain Site Characterization Project, 20:23172 (R;US)

Science Applications International Corp., Los Altos, CA (United States)
Case studies in residual use and energy conservation at wastewater treatment plants, 20:23805 (R;US)

Senator fuer Umweltschutz und Stadtentwicklung, Bremen (Germany)
The lower Weser river in 1993, 20:24636 (I;DE;In German)

Siemens Solar Industries, Camarillo, CA (United States)
Research on high-efficiency, large-area $CuInSe_2$-based thin-film modules. Final subcontract report, 16 August 1993–30 June 1995, 20:23476 (R;US)

Sierra Pacific Power Co., Reno, NV (United States)
Pinon Pine Power Project. Annual report, August 1992–December 1993, 20:23517 (R;US)
Tracy Power Station – Unit No. 4, Pinon Pine Power Project Public Design Report, 20:23516 (R;US)

Sigma Xi, the Scientific Research Society, Inc., Durham, NC (United States)
Science must put its house in order, ethics forum participants conclude, 20:23674 (R;US)

Smith International, Inc., Houston, TX (United States)
Steerable percussion air drilling system, 20:23117 (R;US)

Solar Turbines, Inc., San Diego, CA (United States)
Automated laser scatter detection of surface and subsurface defects in Si_3N_4 components, 20:23880 (R;US)

South Carolina Research Authority, North Charleston, SC (United States)
Revitalize the US silicon/ferrosilicon industry through energy-efficient technology. Part 1, Final report, 20:23777 (R;US)

South Carolina Univ., Columbia, SC (United States)
1991 Technical progress report of the University of South Carolina's High Energy Physics Group, February 1990–July 1991, 20:24774 (R;US)
1992 Technical progress report of the University of South Carolina's High Energy Physics Group, 20:24775 (R;US)
Characterization of the mammalian DNA polymerase gene(s) and enzyme(s). Annual progress report, 20:24651 (R;US)
Characterization of the mammalian DNA polymerase gene and protein. Annual progress report, 20:24652 (R;US)

South Carolina Univ., Columbia, SC (United States). Dept. of Biological Sciences
Characterization of the mammalian DNA polymerase gene(s) and enzyme(s). Annual progress report, 20:24650 (R;US)

South Carolina Univ., Columbia, SC (United States). Savannah River Archaeological Research Program
Annual review of cultural resource investigations by the Savannah River Archaeological Research Program. Fiscal year 1994, 20:23412 (R;US)

South Dakota State Univ., Brookings, SD (United States)
Develop a field grid system for yield mapping and machine control. Quarterly report, April 1, 1995–June 30, 1995, 20:23417 (R;US)

Southern Co. Services, Inc., Birmingham, AL (United States)
Power systems development facility. Quarterly technical progress report, July 1, 1994–September 30, 1994, 20:23013 (R;US)

Southern Illinois Univ., Carbondale, IL (United States). Dept. of Mining Engineering
Management of dry flue gas desulfurization by-products in underground mines. Quarterly report, January–March 1995, 20:23018 (R;US)

Southface Energy Inst., Inc., Atlanta, GA (United States)
Energy efficient affordable housing. Final report, 20:23754 (R;US)

Southwest Research Inst., San Antonio, TX (United States)
Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], January 1–March 31, 1993, 20:23052 (R;US)
Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], April 1–June 30, 1993, 20:23053 (R;US)
Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], April 1–June 30, 1992, 20:23050 (R;US)
Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], July 1–September 30, 1992, 20:23051 (R;US)

SRI International, Menlo Park, CA (United States)
Advanced separation technology for flue gas cleanup. Quarterly technical report Number 12, 20:23523 (R;US)
Advanced separation technology for flue gas cleanup. Quarterly technical report No. 11, October 1994–December 1994, 20:23019 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 1, October 16, 1986–January 15, 1987, 20:23435 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 10, January 1–March 31, 1989, 20:23444 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 2, January 16, 1987–April 15, 1987, 20:23436 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 3, April 16–July 15, 1987, 20:23437 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Final report, October 1, 1986–July 31, 1989, 20:22986 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 4, August 16–October 15, 1987, 20:23438 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 5, November 16, 1987–January 15, 1988, 20:23439 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 6, January 16, 1988–April 15, 1988, 20:23440 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 7, April 16, 1988–July 15, 1988, 20:23441 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 8, July 16–September 30, 1988, 20:23442 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 9, October 1–December 31, 1988, 20:23443 (R;US)

Stanford Linear Accelerator Center, Menlo Park, CA (United States)
Beam distributions beyond RMS, 20:24143 (R;US)
Coupling impedance of a periodic array of diaphragms, 20:24145 (R;US)
Design of traveling wave windows for the PEP-II RF coupling network, 20:24337 (R;US)
Fast symplectic mapping and quasi-invariants for the Large Hadron Collider, 20:24147 (R;US)
Flat beam spot sizes measurement in the SLC-final focus, 20:24146 (R;US)
High-intensity single bunch instability behavior in the new SLC damping ring vacuum chamber, 20:24281 (R;US)
High-power RF window and coupler development for the PEP-II B Factory, 20:24336 (R;US)
Impedance spectrum for the PEP-II RF cavity, 20:24338 (R;US)

Investigation of the beam impedance of a slowly varying waveguide, 20:24283 (R;US)
Loaded delay lines for future RF pulse compression systems, 20:24282 (R;US)
Mixing-induced CP violation in the $D^0\bar{D}^0$ system, 20:24801 (RA;US)
Nanometer resolution BPM using damped slot resonator, 20:24284 (R;US)
Operation and performance of the PEP-II prototype longitudinal damping system at ALS, 20:24280 (R;US)
Optimization of the NLC final focus system, 20:24144 (R;US)
PEP-III magnet power conversion systems: Power supplies for large magnet strings, 20:24341 (R;US)
Proceedings of the REXX symposium for developers and users, 20:25009 (R;US)
Test results of a combined distributed ion pump/non-evaporable getter pump design developed as a proposed alternative pumping system for the PEP-II asymmetric B-Factory collider, 20:24339 (R;US)
The SLC as a second generation linear collider, 20:24092 (R;US)
Transport construction status and commissioning plans, 20:24335 (R;US)

Stanford Univ., CA (United States)
Energy changes in transforming solids. Final report, January 31, 1991–January 31, 1995, 20:23908 (R;US)
Flow and displacement of Bingham plastics in porous media. Topical report, 20:23078 (R;US)
Scaling of bubble growth in a porous medium. Topical report, 20:23081 (R;US)

Stanford Univ., CA (United States). Dept. of Civil Engineering
Fluid dynamics of double diffusive systems. Final report, 20:24019 (R;US)

Stanford Univ., CA (United States). Dept. of Petroleum Engineering
Productivity and injectivity of horizontal wells. Annual report for the period, March 10, 1994–March 9, 1995, 20:23071 (R;US)

Stanford Univ., CA (United States). High Temperature Gasdynamics Lab.
Optical properties of fly ash. Volume 1, Final report, 20:23032 (R;US)
Optical properties of fly ash. Volume 2, Final report, 20:23033 (R;US)

Stanford Univ., CA (United States). Petroleum Research Inst.
Supri heavy oil research program. Annual report, February 8, 1994–February 7, 1995, 20:23082 (R;US)

Statistik der Kohlenwirtschaft e.V., Essen (Germany)
Coal mining situation in the Federal Republic of Germany. First quarter 1995, 20:23024 (I;DE;In German)

Stuttgart Univ. (Germany). Inst. fuer Kernenergetik und Energiesysteme
Verification of KESS-III using PHEBUS in-pile experiments. Status report. Verification and completion of KESS-III, 20:23618 (R;DE;In German)

Superconducting Super Collider Lab., Dallas, TX (United States)
A high reliability oxygen deficiency monitoring system, 20:24290 (R;US)
Accidental beam loss in superconducting accelerators: Simulations, consequences of accidents and protective measures, 20:24294 (R;US)
Coherent production of ϵ^+ particles in crystal using proton beam from SSC, 20:24803 (R;US)
Compensation of the beam-beam effect in proton-proton colliders, 20:24151 (R;US)
Corrector magnets: Combined structural analysis of collider 50 mm aperture ordered wound sextupoles intedrior section, 20:24289 (R;US)
Eddy current and quench loads and stress of SSC collider 4-K liner and the bore tube during magnet quench, 20:24291 (R;US)
Impedance measurements of rf joint (Bellows shield) for collider, 20:24286 (R;US)
Light threshold effects in supersymmetric grand unified theories, 20:24786 (R;US)
Low power RF beam control electronics for the LEB, 20:24288 (R;US)
Magnet Technical Review Panel. Final report, 20:24297 (R;US)
New transverse damper correction scheme, 20:24150 (R;US)
On the feasibility of tracking with differential-algebra maps in long-term stability studies for large hadron colliders, 20:24148 (R;US)
PAC++: Object-oriented platform for accelerator codes, 20:24093 (R;US)
Passing through half-integer resonance due to space charge under different initial distributions, 20:24149 (R;US)
Physics Research Integrated Development Environment (PRIDE), 20:24777 (R;US)
Principles of interaction region design in Hadron Colliders and their application to the SSC, 20:24152 (R;US)
Proceedings of the meetings on the SSC between representatives of industry and high energy physics, 20:24099 (R;US)
Review of experiments, 20:24778 (R;US)
Shielding consideration for the SSCL experimental halls, 20:24095 (R;US)
Supercollider program plan. Phase 1, 20:24096 (R;US)
Superconducting Super Collider Magnet System requirements. Revision A, 20:24285 (R;US)
Superconducting Super Collider management plan. Phase 1, 20:24097 (R;US)
Superconducting Super Collider reference design magnets Style "D" cost design. Contents, 20:24296 (R;US)
Superconducting Super Collider site environmental report for calendar year 1991. Pre-operational, 20:24947 (R;US)
The SSCL framework software plans, 20:24292 (R;US)
Thermal and flow considerations for the 80 K shield of the SSC magnet cryostats, 20:24287 (R;US)
Total cross sections of beauty and charmed mesons on protons, 20:24802 (R;US)
Toward design of the Collider Beam Collimation System, 20:24293 (R;US)
Underground measurements of seismic vibrations at the SSC site, 20:24094 (R;US)
Vertex detectors, 20:24373 (R;US)
Workshop on data acquisition and trigger system simulations for high energy physics, 20:24295 (R;US)

Superconducting Super Collider Lab., Waxahachie, TX (United States)
Electroweak and flavor physics: Implications for the SSC. Second annual SSCL spring conference, 20:24779 (R;US)

T

Technischer Ueberwachungs-Verein Bayern Sachsen e.V., Muenchen (Germany). Zentralabteilung Energietechnische Anlagen und Systeme
Testing of simple solar preheaters with different auxiliary heating systems. Final report, 20:23491 (R;DE;In German)

Technischer Ueberwachungs-Verein Stuttgart e.V., Filderstadt (Germany). Fachabteilung Umweltwirkungen
Application of selected biomonitoring plants in the scope of practical air pollution control. Pt. 1. Transfer of the results of exposure experiments with bioindicator plants to the local vegetation, 20:24733 (R;DE;In German)
Application of selected biomonitoring plants in the scope of practical air pollution control. Pt. 2. Development of an evaluation and assessment procedure on the basis of pollution effect measurements carried out in the Esslingen/Altbach region since 1983, 20:24734 (R;DE;In German)

Tennessee Technological Univ., Cookeville, TN (United States). Dept. of Physics
β-Decay probing the electron bulk correlations, 20:24851 (R;US)
Radioisotope yields from 1.85-GeV protons on Mo and 1.85- and 5.0-GeV protons on Te, 20:24826 (R;US)

TENSA Services, Houston, TX (United States)
New industrial heat pump applications to a synthetic rubber plant. Final report, Phase IIA, 20:23752 (R;US)

Texaco Exploration and Production, Inc., Bridge City, TX (United States)
Post waterflood CO_2 miscible flood in light oil fluvial dominated deltaic reservoirs. Second quarterly technical progress report, [January 1, 1995–March 31, 1995], 20:23085 (R;US)

Texaco Exploration and Production, Inc., New Orleans, LA (United States)
Post waterflood CO_2 miscible flood in light oil, fluvial-dominated deltaic reservoir. Annual report, October 1, 1993–September 30, 1994, 20:23084 (R;US)

Texas A and M Univ., College Station, TX (United States). Dept. of Chemical Engineering
Development of precipitated iron Fischer-Tropsch catalysts. Quarterly technical progress report, 1 January 1995–31 March 1995, 20:22998 (R;US)

Texas A and M Univ., College Station, TX (United States). Texas Engineering Experiment Station
Nodal methods: An information-based analysis. Final report, September 30, 1990–September 30, 1992, 20:24828 (R;US)
Nuclear safety analyses and core design calculations to convert the Texas A & M University Nuclear Science Center reactor to low enrichment uranium fuel. Final report, 20:23595 (R;US)

Texas A and M Univ., Kingsville, TX (United States). Dept. of Chemical and Natural Gas Engineering
Microbially-enhanced redox solution reoxidation for sweetening sour natural gas, 20:23119 (R;US)

Texas Univ., Austin, TX (United States)
Geologic, geochemical, and geographic controls on NORM in produced water from Texas oil, gas, and geothermal reservoirs. Final report, 20:23093 (R;US)
Revitalizing a mature oil play: Strategies for finding and producing unrecovered oil in Frio Fluvial-Deltaic Sandstone Reservoirs of South Texas, 20:23060 (R;US)

Texas Univ., Austin, TX (United States). Bureau of Economic Geology
Secondary natural gas recovery – infield reserve growth joint venture: Applications in midcontinent sandstones, 20:23113 (R;US)

Texas Univ., Austin, TX (United States). Center for Petroleum and Geosystems Engineering
Development of cost-effective surfactant flooding technology. Annual report for the period, September 30, 1993–September 29, 1994, 20:23075 (R;US)

Texas Univ., Austin, TX (United States). Center for Research in Water Resources
Environmental restoration at the Pantex Plant. Quarterly progress report, April 12, 1995–June 30, 1995, 20:24569 (R;US)

Texas Univ., Austin, TX (United States). Fusion Research Center
Texas Experimental Tokamak, a plasma research facility: Technical progress report, 20:24862 (R;US)

Texas Univ., Austin, TX (United States). Inst. for Fusion Studies
Exactly conservative integrators, 20:24980 (R;US)
Revisit to self-organization of solitons for dissipative Korteweg-de Vries equation, 20:24863 (R;US)

Texas Univ., Richardson, TX (United States). Dept. of Chemistry
Tunable composite membranes for gas separations. Progress report, January 1995–April 1995, 20:23912 (R;US)

Thermecon, Champlain, NY (United States)
The recuperator of flue gas heat. Final report, 20:23753 (R;US)

Thermo Electron Corp., Waltham, MA (United States)
CWS-fired residential warm-air heating system. Quarterly report, January 22, 1987–April 30, 1987, 20:23031 (R;US)

Thermochem, Inc., Columbia, MD (United States)
Pulsed atmospheric fluidized bed combustion. Technical progress report, January 1995–April 1995, 20:23030 (R;US)

Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study
A possible microscopic description of nuclear collective rotation in band-crossing region. Occurrence mechanism of s-band, 20:24809 (R;JP)
New approach to the width of giant dipole resonance in hot nuclei, 20:24808 (R;JP)

Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab.
Report of workshop on heat transfer and fluid flow in Fast Breeder Reactor (FBR), Yayoi Research Group, 20:23557 (R;JP;In Japanese)

TRI/Environmental, Inc., Austin, TX (United States)
Laboratory testing of geomembrane for waste containment EPA Method 9090, March 1995. Final report, 20:23800 (R;US)

TRW Environmental Safety Systems, Inc., Las Vegas, NV (United States)
Nevada potential repository preliminary transportation strategy: Study 1, 20:23326 (R;US)

TRW, Inc., Fairfax, VA (United States)
Yucca Mountain Site Characterization Project technical data catalog quarterly supplement, 20:23185 (R;US)

A comparison of model-simulated relative humidity with satellite-derived cloudiness, 20:24465 (RA;US)
A one-dimensional radiative convective model with detailed cloud microphysics, 20:24506 (RA;US)
A short-wave radiometer array across the tropical Pacific Ocean as a component of the TOGA-TAO buoy array, 20:24620 (RA;US)
A stratiform cloud parameterization for general circulation models, 20:24480 (RA;US)
Atmospheric emitted radiance interferometer data analysis methods, 20:24489 (RA;US)
Atmospheric emitted radiance interferometer: Status and water vapor continuum results, 20:24501 (RA;US)
Atmospheric Radiation Measurement Program - unmanned aerospace vehicle: The follow-on phase, 20:24460 (RA;US)
Atmospheric Science Program. Summaries of research in FY 1994, 20:24531 (R;US)
Brightness fields of broken clouds, 20:24525 (RA;US)
Calibration of radiation codes used in climate models: Comparison of clear-sky calculations with observations from the spectral radiation experiment and atmospheric radiation measurement program, 20:24463 (RA;US)
Characterization of the radiative properties of inhomogeneous clouds, 20:24512 (RA;US)
Climate zones for maritime clouds, 20:24518 (RA;US)
Cloud microphysical and radiative properties measured by combined lidar, radar, and infrared radiometer, 20:24476 (RA;US)
Cloud parameterizations in global climate models: The role of aerosols, 20:24498 (RA;US)
Comparison between general circulation model simulation and central equatorial Pacific experiment measurements, 20:24523 (RA;US)
Comparison of stochastic radiation transfer predictions with multi-filter rotating shadowband radiometer data, 20:24470 (RA;US)
Comparisons of brightness temperature measurements and calculations obtained during the spectral radiance experiment, 20:24485 (RA;US)
Design of the aerosol sampling manifold for the Southern Great Plains site, 20:24494 (RA;US)
Development of a hybrid cloud parameterization for general circulation models, 20:24488 (RA;US)
Development of a scheme for parameterizing the effects of cloud condensation nuclei on stratocumulus cloud albedo, 20:24472 (RA;US)
Diagnostic analysis of cloud radiative properties, 20:24508 (RA;US)
Evaluation of two radiative parameterizations using a three-dimensional large-eddy simulation microphysical model, 20:24490 (RA;US)
Explicit simulation of a tropical mesoscale convective system, 20:24464 (RA;US)
Factors influencing the parameterization of tropical anvils within general circulation models, 20:24469 (RA;US)
Graduate student theses supported by DOE's Environmental Sciences Division, 20:23712 (R;US)
Ground- and space-based humidity profiling in a cloudy atmosphere with strong elevated temperature inversion, 20:24511 (RA;US)
Ground-based radiometric observations of atmospheric water for climate research, 20:24507 (RA;US)
Implementation of Raman lidar for profiling of atmospheric water vapor and aerosols at the Southern Great Plains Cloud and Radiation Testbed Site, 20:24481 (RA;US)
Long-pathlength infrared absorption measurements in the 8- to 14-μm atmospheric window: Self-broadening coefficient data, 20:24492 (RA;US)
Mean fluxes of the near-infrared radiation in broken clouds, 20:24526 (RA;US)
Mean fluxes of visible solar radiation in broken clouds, 20:24527 (RA;US)
Measurements and modeling of the effect of convective clouds on the upper tropospheric moisture budget, 20:24468 (RA;US)
Mesoscale simulations of convective systems with data assimilation during June 1993 in the Southern Great Plains, 20:24474 (RA;US)
Millimeter-wavelength cloud measurements taken with the polarimetric cloud profiling radar system, 20:24505 (RA;US)
Modeling and observing the optical thickness of low clouds, 20:24473 (RA;US)
MODTRAN3: Suitability as a flux-divergence code, 20:24466 (RA;US)
Monte Carlo simulation of longwave fluxes through broken scattering cloud fields, 20:24513 (RA;US)
North Slope of Alaska and adjacent Arctic Ocean cloud and radiation testbed: Science and siting strategies, 20:24457 (RA;US)
Objective analysis schemes to monitor atmospheric radiation measurement data in near real-time, 20:24509 (RA;US)
Observations from the central equatorial Pacific Experiment and their significance to siting and modeling objectives of the Atmospheric Radiation Measurement Program, 20:24622 (RA;US)
Observations of tropical cirrus properties in the pilot radiation observation experiment using lidar and the CSIRO ARM filter radiometer, 20:24499 (RA;US)
On the fundamental role of tropospheric radiative cooling on the diurnal cycle of intense tropical convection, 20:24482 (RA;US)
Overview of North Slope of Alaska/adjacent Arctic Ocean Science issues, 20:24459 (RA;US)
Parameterization of thin mid-level stratiform clouds, 20:24491 (RA;US)
Preliminary analysis of ground-based microwave and infrared radiance observations during the pilot radiation OBservation experiment, 20:24456 (RA;US)
Preliminary analysis of ground-based microwave and infrared radiance observations during the Pilot Radiation OBservation Experiment, 20:24516 (RA;US)
Quality measurement experiments within the Atmospheric Radiation Measurement Program, 20:24454 (RA;US)

Radar/radiometer retrievals of cloud liquid water and drizzle: Analysis using data from a three-dimensional large eddy simulation of marine stratocumulus clouds, 20:24477 (RA;US)
Radiation impacts on global climate models, 20:24467 (RA;US)
Radiation singularities, multiple scattering and diffusion in multifractal clouds, 20:24502 (RA;US)
Radiometric sounding system, 20:24519 (RA;US)
Residual analysis of surface spectral radiances between instrument observations and line-by-line calculations, 20:24471 (RA;US)
Scale-invariance, non-stationarity and intermittency in the structure of cloudiness, 20:24455 (RA;US)
Scanning Raman lidar measurements of atmospheric water vapor and aerosols, 20:24478 (RA;US)
Sensitivity analysis with adjoint of radiation code, 20:24524 (RA;US)
Sensitivity of cirrus cloud radiative properties to ice crystal size and shape in general circulation model simulations, 20:24496 (RA;US)
Ship-based measurements of cloud optical properties during the Atlantic Stratocumulus Transition Experiment, 20:24517 (RA;US)
Single-column data assimilation for the Atmospheric Radiation Measurement Program, 20:24495 (RA;US)
Single-column model and cumulus ensemble model simulations of GATE data, 20:24500 (RA;US)
Single-column model for atmospheric radiation measurement sites: Model development and sensitivity test, 20:24521 (RA;US)
Single-column models as a bridge between observations and climate models, 20:24453 (RA;US)
Solar heating in the upper ocean, 20:24510 (RA;US)
Solar radiance transmission interferometer observations at the Southern Great Plains Cloud and Radiation Testbed site, 20:24497 (RA;US)
Special working session on the role of buoy observations in the tropical Western Pacific measurement scheme, 20:24619 (RA;US)
Stratus cloud measurements with a K_a-band Doppler radar and a microwave radiometer, 20:24479 (RA;US)
Summary of single-column model intensive observation period workshop at annual atmospheric radiation measurement science team meeting, 20:24461 (RA;US)
Surface flux intercomparison between the MM5 model and observations during the storm-scale observations regional measurement program - fronts experiment systems test 1992, 20:24475 (RA;US)
Surface Heat Budget of the Arctic Ocean (SHEBA), 20:24458 (RA;US)
Testing of Newtonian nudging technique in data assimilation on the meso-beta-scale, 20:24483 (RA;US)
The effects of arctic stratus clouds on the solar energy budget in the atmosphere-sea ice-ocean system, 20:24487 (RA;US)
The effects of radiative transfer on low-level cyclogenesis, 20:24493 (RA;US)
The effects of radiative transfer in maintaining the Indian summer monsoon, 20:24623 (RA;US)
The impacts of data error and model resolution on the result of variational data assimilation, 20:24522 (RA;US)
The role of water vapor, clouds, and the large-scale circulation in regulating sea surface temperatures in the tropical Pacific, 20:24621 (RA;US)
Toward an operational water vapor remote sensing system using the global positioning system, 20:24484 (RA;US)
Treatment of cloud radiative effects in general circulation models, 20:24515 (RA;US)
Triggering of boundary layer cumulus clouds over a heterogeneous surface, 20:24504 (RA;US)
Unmanned Aerospace Vehicle Workshop, 20:24462 (RA;US)
Use of a cloud ensemble model to develop cloudiness parameterizations, 20:24520 (RA;US)
Use of cloud and radiation testbed measurements to evaluate cloud cover and convective parameterizations, 20:24514 (RA;US)
Vegetation forcing and convective motion, 20:24486 (RA;US)
Warm pool physics in a coupled general circulation model, 20:24503 (RA;US)

45-day safety screen results and final report for tank 241-C-202, auger samples 95-Aug-026 and 95-Aug-027, 20:23278 (R;US)
45-Day safety screen results for Tank 241-U-201, push mode, cores 70, 73 and 74, 20:23274 (R;US)
45-Day safety screen results for Tank 241-C-101, auger sample 95-AUG-019, 20:23275 (R;US)
45-day safety screen results for tank 241-C-204, auger samples 95-Aug-022 and 95-Aug-023, 20:23277 (R;US)
60-day safety screen results and final report for tank 241-C-111, auger samples 95-Aug-002, 95-Aug-003, 95-Aug-016, and 95-Aug-017, 20:23276 (R;US)
A model for determining the scope and level of detail that is appropriate for a programmatic EIS, 20:23709 (R;US)
AutoCAD discipline layering convention. Revision 1, 20:25019 (R;US)
Automated Transportation Management System (ATMS) Software Project Management Plan (SPMP). Revision 2, 20:23156 (R;US)
Calcination/dissolution residue treatment, 20:23255 (R;US)
Closed loop cooling operation with MICON, 20:23146 (R;US)
Cost benefit and risk assessment for selected tank waste process testing alternatives, 20:23377 (R;US)
Criticality safety evaluation for long term storage of FFTF fuel in interim storage casks, 20:23151 (R;US)
CSER 95-003: Exemption from Criticality Alarm System requirement for 232-Z building, 20:24016 (R;US)
CSER 95-005: PFP vertical denitration calciner, 20:23266 (R;US)
Data quality objectives for the initial fuel conditioning examinations, 20:23153 (R;US)
Definition and means of maintaining the supply ventilation system seismic shutdown portion of the PFP safety envelope. Revision 2, 20:23375 (R;US)
Disposal facility data for the interim performance, 20:23303 (R;US)
Double shell tanks plutonium inventory assessment, 20:23305 (R;US)
Dropping of mixing pump in Tank 102-AP, 20:23292 (R;US)
Electrical/instrumentation acceptance test report for Project C-018H, 242-A Evaporator/PUREX Plant condensate treatment facility, 20:23259 (R;US)
Evaluation of remaining life of the double-shell tank waste systems, 20:23291 (R;US)
Facility effluent monitoring plan for the tank farms facilities, 20:23254 (R;US)
FFTF Plant transition mission analysis report, 20:23610 (R;US)
Functions and requirements for Hanford single-shell tank leakage detection and monitoring, 20:23299 (R;US)
Groundwater monitoring plan for the 300 Area process trenches, 20:23334 (R;US)
Groundwater screening evaluation/monitoring plan: 200 Area Treated Effluent Disposal Facility (Project W-049H). Revision 1, 20:23262 (R;US)
GXQ program verification and validation. Revision 1, 20:24556 (R;US)
Half-liter supernatant sampler system engineering work plan, 20:23313 (R;US)
Hanford Action Tracking System release planning support documents, 20:24949 (R;US)
Hanford Sampling Quality Management Plan (HSQMP), 20:23354 (R;US)
Hazard categorization and baseline documentation for the Sodium Storage Facility. Revision 1, 20:23263 (R;US)
Hot sample archiving. Revision 3, 20:23267 (R;US)
Identification of potential transuranic waste tanks at the Hanford Site, 20:23296 (R;US)
Ignitability testing for core drilling system. Final report, 20:23310 (R;US)
In situ monitoring of grouted electrolytes, 20:23257 (R;US)
In situ vapor sampling system test procedure, 20:23271 (R;US)
Interim-status groundwater monitoring plan for .the 216-B-63 trench. Revision 1, 20:23261 (R;US)

Laboratory testing of geomembrane for waste containment EPA Method 9090, March 1995. Final report, 20:23800 (R;US)
Liquid Effluent Monitoring Information System test plans releases 2.0 and 3.0, 20:23309 (R;US)
MCNP visual editor computer code manual, 20:24833 (R;US)
Measurements of the corrosion of low-carbon steel drums under environmental conditions at Hanford: One-year test results, 20:24014 (R;US)
Mid-year report: IPC liaison and chemistry of thermal reconstitution, 20:23314 (R;US)
Moisture monitoring and control system engineering study, 20:23297 (R;US)
Multi-function Waste Tank Facility path forward engineering analysis – Technical Task 3.6, Estimate of operational risk in 200 West Area, 20:23268 (R;US)
Operator coil monitoring acceptance test procedure, 20:23270 (R;US)
PFP supply fan motor starters, 20:23373 (R;US)
PFP Wastewater Sampling Facility, 20:23260 (R;US)
Plan for characterization of K Basin spent nuclear fuel and sludge, 20:23265 (R;US)
Pre-1970 transuranic solid waste at the Hanford Site, 20:23295 (R;US)
Process control plan for 242-A Evaporator Campaign 95-1, 20:23301 (R;US)
Project C-018H, 242-A evaporator/PUREX Plant Process Condensate Treatment Facility Instrumentation and Control (I&C), 20:23258 (R;US)
PUREX Plant deactivation mission analysis report, 20:23374 (R;US)
Quality Assurance Program Plan for FFTF effluent controls. Revision 1, 20:23589 (R;US)
R-1 (C-620-A) and R-2 (C-620-B) air compressor control logic, computer software description. Revision 1, 20:23608 (R;US)
R-189 (C-620) air compressor control logic software documentation. Revision 1, 20:23609 (R;US)
Safety evaluation for packaging CPC metal boxes, 20:23376 (R;US)
Solid waste handling, 20:23308 (R;US)
Statement of work for analytical services provided to Westinghouse Hanford Company by the Pacific Northwest Laboratory Analytical Chemistry Laboratory, 20:23333 (R;US)
Statements of work for FY 1996 to 2001 for the Hanford Low-Level Tank Waste Performance Assessment Project, 20:23300 (R;US)
Strategy for resolution of the Flammable Gas Safety Issue, 20:23307 (R;US)
Stress analysis of single port (ISB) jumper connectors for 2-, 3-, and 4-in. sizes, 20:23157 (R;US)
Stress evaluation of the primary tank of a double-shell underground storage tank facility, 20:23256 (R;US)
Structural analysis of 241C106 contingency chiller design, 20:23273 (R;US)
Structural evaluation of mixer pump installed in Tank 241-AN-107 for caustic addition project, 20:23272 (R;US)
Survey package: Technical and contracting strategies for single-shell tank waste retrieval on the Hanford Site, 20:23304 (R;US)
Tank 241-B-106 push mode core sampling and analysis plan, 20:23311 (R;US)
Tank 241-BY-103 vapor sampling and analysis tank characterization report, 20:23288 (R;US)
Tank 241-BY-104 vapor sampling and analysis tank characterization report, 20:23281 (R;US)
Tank 241-BY-105 vapor sampling and analysis tank characterization report, 20:23282 (R;US)
Tank 241-BY-106 vapor sampling and analysis tank characterization report, 20:23283 (R;US)
Tank 241-BY-108 vapor sampling and analysis tank characterization report, 20:23284 (R;US)
Tank 241-BY-110 vapor sampling and analysis tank characterization report, 20:23289 (R;US)
Tank 241-C-101 vapor sampling and analysis tank characterization report, 20:23294 (R;US)
Tank 241-C-106 process test report, 20:23287 (R;US)
Tank 241-C-111 vapor sampling and analysis tank characterization report, 20:23285 (R;US)
Tank 241-C-112 vapor sampling and analysis tank characterization report, 20:23286 (R;US)
Tank 241-U-106 vapor sampling and analysis tank characterization report, 20:23293 (R;US)
Tank characterization report for Double-Shell Tank 241-SY-102, 20:23280 (R;US)
Tank waste remediation system: An update, 20:23372 (R;US)
Test plan for anion exchange testing with Argonne 10-L solutions, 20:23147 (R;US)
Test plan/procedure for the shock limiting device of the radioisotope thermoelectric generator package mounting subsystem 145. Revision 1, 20:24015 (R;US)
Test plan/procedure for the SPM-1 shipping container system. Revision 0, 20:24017 (R;US)
Test Plan: Phase 1 demonstration of 3-phase electric arc melting furnace technology for vitrifying high-sodium content low-level radioactive liquid wastes, 20:23312 (R;US)
Test procedure for the Master-Lee and the modified Champion four inch hydraulic cutters, 20:23154 (R;US)
The societal impact value of risk, 20:24738 (R;US)
Using digital systems to control air pulsers, 20:23145 (R;US)
Waste characterization of the 101-SY hydrogen mitigation mixing pump shipping container, 20:23306 (R;US)
Waste Encapsulation and Storage Facility mission analysis report, 20:23158 (R;US)
Waste tank headspace gas and vapor characterization reference guide, 20:23290 (R;US)
Westinghouse Hanford Company Health and Safety Performance Report. First quarter calendar year 1995, 20:23378 (R;US)
Westinghouse Hanford Company recommended strategy for K Basin sludge disposition, 20:23155 (R;US)
WHC-SD-W252-FHA-001, Rev. 0: Preliminary fire hazard analysis for Phase II Liquid Effluent Treatment and Disposal Facility, Project W-252, 20:23269 (R;US)

Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States)
Vortex diode jet, 20:23576 (PA;US)

Westinghouse Savannah River Co., Aiken, SC (United States)
Apparatus and method for detecting gamma radiation, 20:24371 (PA;US)
Assessment of Noble Gases in the Savannah River Site Environment, 20:23590 (R;US)
Detecting small holes in packages, 20:24712 (PA;US)
Fiber optic probe having fibers with endfaces formed for improved coupling efficiency, 20:24386 (PA;US)
Flexible pipe crawling device, 20:23995 (PA;US)
Human Reliability Analysis for In-Tank Precipitation Alignment and Startup of Emergency Purge Ventilation Equipment. Revision 4, 20:23379 (R;US)
Ion cyclotron resonance cell, 20:24400 (PA;US)
Isothermal heat measurements of TBP-nitric acid solutions, 20:23380 (R;US)
Monitoring probe for groundwater flow, 20:24401 (PA;US)
Quarterly sampling of the wetlands along the old F-Area effluent ditch: August 1994. Revision 1, 20:23335 (R;US)
Savannah River Technology Center monthly report – October 1994, 20:23129 (R;US)
The Speciation of Groundwater Contaminated with Coal Pile Leachate at the Savannah River Site, South Carolina, 20:24616 (R;US)
Uranium partitioning under acidic conditions in a sandy soil aquifer, 20:24615 (R;US)

Whatcom, County of, WA (United States)
BPA/Puget Power Northwest Washington Transmission Project. Final Environmental Impact Statement, 20:23662 (R;US)

Wisconsin Univ., Madison, WI (United States)
Initial data from a new High Spectral Resolution Lidar. Appendix A, 20:24382 (R;US)

Wisconsin Univ., Madison, WI (United States). Dept. of Plant Pathology
Molecular genetics of ligninase expression. Progress report, 20:23421 (R;US)

Wisconsin Univ., Madison, WI (United States). Plasma Physics Research
High current plasma electron emitter, 20:24860 (R;US)
Wisconsin Univ., Milwaukee, WI (United States)
Development of lead-free copper alloy-graphite castings. Technical report, January 1994–December 1994, 20:23911 (R;US)
Wyoming Univ., Laramie, WY (United States)
DOE/EPSCoR Traineeship Program: Progress report, academic year 1992–93. Annual report 1993, 20:24926 (R;US)
DOE/EPSCoR Traineeship Program: Final report, 1994, 20:24927 (R;US)
Wyoming Univ., Laramie, WY (United States). Inst. for Energy Research
Anisotropy and spatial variation of relative permeability and lithologic character of Tensleep Sandstone reservoirs in the Bighorn and Wind River Basins, Wyoming. Second quarterly, second year, technical progress report, January 1, 1995–March 31, 1995, 20:23077 (R;US)

X

Xerox Palo Alto Research Center, CA (United States)
Research on the stability, electronic properties, and structure of a-Si:H and its alloys. Final subcontract report, 1 June 1991–31 May 1994, 20:23477 (R;US)

Y

Yale Univ., New Haven, CT (United States). Dept. of Chemistry
Energies of organic compounds. Final report, 20:23956 (R;US)
Energies of organic compounds. Technical progress report, 20:23955 (R;US)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.

Subject Index

This index is arranged by subject descriptors selected from those assigned to each citation in this publication. Subject descriptors are selected from a controlled thesaurus of terms, ETDE/PUB–2(Rev.1), *International Energy: Subject Thesaurus*. In order to enhance indexing, subject descriptor entries generally consist of a pair of descriptors: a main term and a qualifier term. Each entry includes the full title (which may be followed by supplementary descriptive information in parentheses) and the citation number. Additional information given in parentheses indicates the document type (an abbreviation such as B for book), the country of publication (such as DE for Federal Republic of Germany), and the language if non-English.

See references guide users from synonymous terms to the descriptors selected for the concept. *See also* references indicate subject concepts that are more specific than a particular descriptor. To gain complete subject coverage, all such terms should be reviewed.

Development of General Purpose Data Acquisition Shell (GPDAS), 20:24260 (R;US)

Dc To Dc Converters
Tests on conducted electrical noise on a storage ring dc-dc converter cabinet, 20:24273 (R;US)

Digital Filters
Effect of vacuum chamber eddy current and compensation by digital feedback, 20:24269 (R;US)

Digital Systems
Digital signal processing for the APS transverse and longitudinal damping system, 20:24168 (R;US)

Electromagnetic Fields
3-D computer simulations of EM field sin the APS vacuum chamber. Part 2: Time-domain analysis, 20:24330 (R;US)

Electron Guns
Cavity design and beam simulations for the APS rf gun, 20:24259 (R;US)

Linear Accelerators
A high gradient superconducting quadrupole for a low charge state ion linac, 20:24174 (R;US)
Bunch length measurements at the Advanced Photon Source (APS) linear accelerator, 20:24163 (R;US)
Design and testing of a high power, ultra-high vacuum, dual-directional coupler for the Advanced Photon Source (APS) linear accelerator, 20:24161 (R;US)
Performance of the advanced photon source (APS) linac beam position monitors (BPMs) with logarithmic amplifier electronics, 20:24170 (R;US)
Positron focusing in the Advanced Photon Source (APS) linear accelerator, 20:24165 (R;US)

Magnetic Fields
Effect of eddy current in the laminations on the magnet field, 20:24263 (R;US)

Magnetic Probes
Interpolation of Hall probe calibration data, 20:24267 (R;US)

Magnets
A radial coil probe for quadrupole magnet measurements, 20:24251 (R;US)

Monochromators
Identification of root cause of vibration of a liquid-gallium-cooled silicon monochromator and recommendations for abatement, 20:24278 (R;US)

Positrons
A positron accumulator ring for APS, 20:24329 (R;US)

Power Supplies
Power supply control units for APS ring magnets, 20:24258 (R;US)

Pressure Vessels
APS storage ring vacuum chamber tests for dimensional stability after bakeout cycling while under vacuum, 20:24250 (R;US)
Cleaning of aluminum after machining with coolants, 20:24255 (R;US)
Effect of vacuum chamber eddy current and compensation by digital feedback, 20:24269 (R;US)

Radiation Monitors
Status of the synchrotron radiation monitors for the APS facility rings, 20:24160 (R;US)

Radiation Protection
The effect of incident angle on the shielding thickness for secondary bremsstrahlung, 20:24277 (R;US)

Rf Systems
APS injector synchrotron low-level RF system design and test, 20:24154 (R;US)

Safety Analysis
Advanced Photon Source experimental beamline Safety Assessment Document: Addendum to the Advanced Photon Source Accelerator Systems Safety Assessment Document (APS-3.2.2.1.0), 20:24178 (R;US)
Septum Magnets
Electromagnetic field analysis of septum magnet for APS positron accumulator ring, 20:24274 (R;US)
The APS direct-drive pulsed septum magnets, 20:24162 (R;US)
Shutters
Thermo-mechanical optimization of photon shutter 1 for APS front ends, 20:24266 (R;US)
Thermo-mechanical parametric studies of Fixed Mask 1 and Photon Shutter 2 for APS front ends, 20:24268 (R;US)
Standards
Nomenclature and name assignment rules for the APS storage ring, 20:24091 (R;US)
Storage Rings
Commissioning of the Argonne positron accumulator ring, 20:24164 (R;US)
Vacuum Systems
3-D computer simulations of EM field sin the APS vacuum chamber. Part 2: Time-domain analysis, 20:24330 (R;US)
The vacuum system for insertion devices at the Advanced Photon Source, 20:24177 (R;US)
Valves
RF characteristics of the APS storage ring isolation valve, 20:24272 (R;US)
Wiggler Magnets
Results of magnetic measurements and field integral compensation for the Elliptical Multipole Wiggler, 20:24176 (R;US)

AERIAL MONITORING
A lightweight high performance dual-axis gimbal for space applications, 20:23799 (R;US)

AEROSOL MONITORING
Design of the aerosol sampling manifold for the Southern Great Plains site, 20:24494 (RA;US)

AEROSOLS
Cloud parameterizations in global climate models: The role of aerosols, 20:24498 (RA;US)
Depth resolving analysis of outdoor aerosol particles with secondary mass spectrometry, 20:24542 (R;DE;In German)
Desert Research Institute cloud droplet videometer measurements in support of MASTEX, 20:24545 (R;US)
Real-time chemical analysis of aerosol particles, 20:24528 (R;US)
Scanning Raman lidar measurements of atmospheric water vapor and aerosols, 20:24478 (RA;US)

AFTERLOADING
Human factors evaluation of remote afterloading brachytherapy: Human error and critical tasks in remote afterloading brachytherapy and approaches for improved system performance. Volume 1, 20:24702 (R;US)

AGE GROUPS
See also ADOLESCENTS
ADULTS
Demographic forecasting modelling and prediction of Japanese population, 20:23681 (R;JP;In Japanese)

CARBON STEELS
Corrosion of candidate materials in Lake Rotokawa geothermal exposure, 20:23930 (R;US)
Measurements of the corrosion of low-carbon steel drums under environmental conditions at Hanford: One-year test results, 20:24014 (R;US)
CARBON TETRACHLORIDE
Deploying in situ bioremediation at the Hanford Site, 20:23366 (R;US)
The use of bench- and field-scale data for design of an in situ carbon tetrachloride bioremediation system, 20:24608 (R;US)
Ultrasonic process for remediation of organics-contaminated groundwater/wastewater, 20:23337 (R;US)
CARBONATES
Vitrification development for mixed wastes, 20:23233 (R;US)
CARBONYLS
Energies of organic compounds. Final report, 20:23956 (R;US)
CARCINOGENESIS
Molecular genetics of cancer, 20:24642 (R;US)

CARCINOMAS
Interim report on intrathoracic radiotherapy of human small-cell lung carcinoma in nude mice with Re-188-RC-160, a radiolabeled somatostatin analogue, 20:24699 (R;US)

CARDIOVASCULAR SYSTEM
Adaptive life simulator: A novel approach to modeling the cardiovascular system, 20:24708 (R;US)

CARPETBAG EVENT
See NUCLEAR EXPLOSIONS
UNDERGROUND EXPLOSIONS

CASCADE (EXTRACTION)
See EXTRACTION COLUMNS

CASTING
Process simulator for time-dependent material and energy flow in a continuous casting system, 20:24009 (R;US)

CASTING MOLDS
Simulation of fluid flow induced by opposing ac magnetic fields in a continuous casting mold, 20:23774 (R;US)

CATALYST SUPPORTS
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 4, August 16–October 15, 1987, 20:23438 (R;US)

CATALYSTS
Chemical Preparation
Development of precipitated iron Fischer-Tropsch catalysts. Quarterly technical progress report, 1 January 1995–31 March 1995, 20:22998 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 6, January 16, 1988–April 15, 1988, 20:23440 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 7, April 16, 1988–July 15, 1988, 20:23441 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 5, November 16, 1987–January 15, 1988, 20:23439 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 1, October 16, 1986–January 15, 1987, 20:23435 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 8, July 16–September 30, 1988, 20:23442 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 3, April 16–July 15, 1987, 20:23437 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 4, August 16–October 15, 1987, 20:23438 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 2, January 16, 1987–April 15, 1987, 20:23436 (R;US)
Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 12, July–September 1994, 20:23960 (R;US)
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, October–December 1993, 20:22987 (R;US)
Technology development for cobalt F-T catalysts. Quarterly technical progress report No. 8, July 1, 1994–September 30, 1994, 20:22992 (R;US)
Infrared Spectra
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 9, October 1–December 31, 1988, 20:23443 (R;US)
Performance Testing
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 6, January 16, 1988–April 15, 1988, 20:23440 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 3, April 16–July 15, 1987, 20:23437 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 4, August 16–October 15, 1987, 20:23438 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 7, April 16, 1988–July 15, 1988, 20:23441 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 9, October 1–December 31, 1988, 20:23443 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 5, November 16, 1987–January 15, 1988, 20:23439 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 2, January 16, 1987–April 15, 1987, 20:23436 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 1, October 16, 1986–January 15, 1987, 20:23435 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 8, July 16–September 30, 1988, 20:23442 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 10, January 1–March 31, 1989, 20:23444 (R;US)
Selective methane oxidation over promoted oxide catalysts. Quarterly report, December 1994–February 1995, 20:23433 (R;US)
Technology development for cobalt F-T catalysts. Quarterly technical progress report No. 8, July 1, 1994–September 30, 1994, 20:22992 (R;US)

CATHODES
See also PHOTOCATHODES
Magnetron cathodes in plasma electrode pockels cells, 20:24387 (PA;US)

CAVITY RESONATORS
See also SUPERCONDUCTING CAVITY RESONATORS
Accelerating resonators with mechanical frequency tuning, 20:24223 (IA;RU;In Russian)
Beam loading of an active resonator in a stationary mode, 20:24121 (IA;RU;In Russian)
Cavity design and beam simulations for the APS rf gun, 20:24259 (R;US)
Combined accelerating structure with optimized multi resonator buncher, 20:24219 (IA;RU;In Russian)
Cooling the APS storage ring radio-frequency accelerating cavities: Thermal/stress/fatigue analysis and cavity cooling configuration, 20:24299 (R;US)
Fundamental mode frequency of the storage ring single cell cavity, 20:24264 (R;US)
Investigation of multipactoring discharge in an H-type resonator of an ion linac, 20:24221 (IA;RU;In Russian)
RF-power recuperation system of the final part of Kharkov large accelerator for material sciences, 20:24083 (IA;RU;In Russian)
The RHIC accelerating cavity prototype tuner, 20:24300 (R;US)

CE LUMMUS CFFC PROCESS
See COAL LIQUEFACTION

CE STANDARD REACTOR
Standard technical specifications: Combustion engineering plants. Volume 1, Revision 1: Specifications, 20:23623 (R;US)
Standard technical specifications: Combustion engineering plants. Volume 3, Revision 1: Bases (Sections 3.4–3.9), 20:23624 (R;US)

CELLS (BACTERIAL)

Monte Carlo simulation of longwave fluxes through broken scattering cloud fields, 20:24513 (RA;US)
Instability
Stratus cloud measurements with a K_a-band Doppler radar and a microwave radiometer, 20:24479 (RA;US)

Interferometry
Atmospheric emitted radiance interferometer: Status and water vapor continuum results, 20:24501 (RA;US)

Mixing Ratio
Use of a cloud ensemble model to develop cloudiness parameterizations, 20:24520 (RA;US)

Moisture
Radar/radiometer retrievals of cloud liquid water and drizzle: Analysis using data from a three-dimensional large eddy simulation of marine stratocumulus clouds, 20:24477 (RA;US)

Monitoring
Desert Research Institute cloud droplet videometer measurements in support of MASTEX, 20:24545 (R;US)

Multi-Parameter Analysis
A stratiform cloud parameterization for general circulation models, 20:24480 (RA;US)
Evaluation of two radiative parameterizations using a three-dimensional large-eddy simulation microphysical model, 20:24490 (RA;US)

Multiple Scattering
A one-dimensional radiative convective model with detailed cloud microphysics, 20:24506 (RA;US)
Radiation singularities, multiple scattering and diffusion in multifractal clouds, 20:24502 (RA;US)

Optical Properties
Evaluation of two radiative parameterizations using a three-dimensional large-eddy simulation microphysical model, 20:24490 (RA;US)
Modeling and observing the optical thickness of low clouds, 20:24473 (RA;US)
Monte Carlo simulation of longwave fluxes through broken scattering cloud fields, 20:24513 (RA;US)
Observations of tropical cirrus properties in the pilot radiation observation experiment using lidar and the CSIRO ARM filter radiometer, 20:24499 (RA;US)
Parameterization of thin mid-level stratiform clouds, 20:24491 (RA;US)
Ship-based measurements of cloud optical properties during the Atlantic Stratocumulus Transition Experiment, 20:24517 (RA;US)
The effects of arctic stratus clouds on the solar energy budget in the atmosphere-sea ice-ocean system, 20:24487 (RA;US)
Treatment of cloud radiative effects in general circulation models, 20:24515 (RA;US)

Parametric Analysis
A comparison of model-simulated relative humidity with satellite-derived cloudiness, 20:24465 (RA;US)
Atmospheric emitted radiance interferometer data analysis methods, 20:24489 (RA;US)
Cloud microphysical and radiative properties measured by combined lidar, radar, and infrared radiometer, 20:24476 (RA;US)
Development of a hybrid cloud parameterization for general circulation models, 20:24488 (RA;US)
Diagnostic analysis of cloud radiative properties, 20:24508 (RA;US)
Factors influencing the parameterization of tropical anvils within general circulation models, 20:24469 (RA;US)
Implementation of Raman lidar for profiling of atmospheric water vapor and aerosols at the Southern Great Plains Cloud and Radiation Testbed Site, 20:24481 (RA;US)
Mesoscale simulations of convective systems with data assimilation during June 1993 in the Southern Great Plains, 20:24474 (RA;US)
Millimeter-wavelength cloud measurements taken with the polarimetric cloud profiling radar system, 20:24505 (RA;US)
Parameterization of thin mid-level stratiform clouds, 20:24491 (RA;US)
Preliminary analysis of ground-based microwave and infrared radiance observations during the Pilot Radiation OBservation Experiment, 20:24516 (RA;US)
Sensitivity analysis with adjoint of radiation code, 20:24524 (RA;US)
Single-column model and cumulus ensemble model simulations of GATE data, 20:24500 (RA;US)
Single-column model for atmospheric radiation measurement sites: Model development and sensitivity test, 20:24521 (RA;US)
Stratus cloud measurements with a K_a-band Doppler radar and a microwave radiometer, 20:24479 (RA;US)
Triggering of boundary layer cumulus clouds over a heterogeneous surface, 20:24504 (RA;US)
Use of cloud and radiation testbed measurements to evaluate cloud cover and convective parameterizations, 20:24514 (RA;US)

Particle Size
Millimeter-wavelength cloud measurements taken with the polarimetric cloud profiling radar system, 20:24505 (RA;US)

Physical Properties
A one-dimensional radiative convective model with detailed cloud microphysics, 20:24506 (RA;US)
Overview of North Slope of Alaska/adjacent Arctic Ocean Science issues, 20:24459 (RA;US)

Radiant Heat Transfer
Atmospheric emitted radiance interferometer: Status and water vapor continuum results, 20:24501 (RA;US)
Characterization of the radiative properties of inhomogeneous clouds, 20:24512 (RA;US)
Diagnostic analysis of cloud radiative properties, 20:24508 (RA;US)
Single-column model for atmospheric radiation measurement sites: Model development and sensitivity test, 20:24521 (RA;US)
The effects of radiative transfer on low-level cyclogenesis, 20:24493 (RA;US)
Treatment of cloud radiative effects in general circulation models, 20:24515 (RA;US)

Radiometric Analysis
Ground-based radiometric observations of atmospheric water for climate research, 20:24507 (RA;US)
Observations of tropical cirrus properties in the pilot radiation observation experiment using lidar and the CSIRO ARM filter radiometer, 20:24499 (RA;US)
Radar/radiometer retrievals of cloud liquid water and drizzle: Analysis using data from a three-dimensional large eddy simulation of marine stratocumulus clouds, 20:24477 (RA;US)

Reflection
The effects of arctic stratus clouds on the solar energy budget in the atmosphere-sea ice-ocean system, 20:24487 (RA;US)

Remote Sensing
Cloud microphysical and radiative properties measured by combined lidar, radar, and infrared radiometer, 20:24476 (RA;US)

Simulation
Factors influencing the parameterization of tropical anvils within general circulation models, 20:24469 (RA;US)

Temperature Distribution
Ground- and space-based humidity profiling in a cloudy atmosphere with strong elevated temperature inversion, 20:24511 (RA;US)

Thickness
Modeling and observing the optical thickness of low clouds, 20:24473 (RA;US)

CLUSTER MODEL
Covariant cluster dynamics of nucleons and mesons, 20:24798 (IA;RU)

CLUSTERS (FUEL ELEMENTS)
See FUEL ELEMENT CLUSTERS

CLUSTERS (SOLID)
See SOLID CLUSTERS

CO-GENERATION
See COGENERATION

COAL
See also COAL FINES
SUBBITUMINOUS COAL

Agglomeration
Micro-agglomerate flotation for deep cleaning of coal. Quarterly progress report, January 1, 1995–March 31, 1995, 20:22981 (R;US)

Briquetting
Emissions reductions in coal-fired home heating stoves through use of briquettes. Quarterly report, January 1, 1995–March 31, 1995, 20:23041 (R;US)

Carbonization
Second generation pressurized fluidized-bed combustion (PFBC) research and development, Phase 2 — Task 4, carbonizer testing. Volume 2, Data reconciliation, 20:23029 (R;US)
Second generation pressurized fluidized-bed combustion (PFBC) research and development, Phase 2 – Task 4, carbonizer testing. Volume 1, Test results, 20:23028 (R;US)

Cleaning
Precombustion desulfurization using Microcel™ and multi-gravity separator, 20:22979 (RA;US)

Coal Liquefaction
Subsidies for promotion of coal production/utilization technology. Second Clean Coal Technology (CCT) Conference, 20:22978 (R;JP;In Japanese)

Coal Mining
Subsidies for promotion of coal production/utilization technology. Second Clean Coal Technology (CCT) Conference, 20:22978 (R;JP;In Japanese)

Coal Preparation
Subsidies for promotion of coal production/utilization technology. Second Clean Coal Technology (CCT) Conference, 20:22978 (R;JP;In Japanese)

Combustion
CWS-fired residential warm-air heating system. Quarterly report, January 22, 1987–April 30, 1987, 20:23031 (R;US)
Coal char fragmentation during pulverized coal combustion, 20:23044 (R;US)
Coal combustion science. Quarterly progress report, April 1994–June 1994, 20:23045 (R;US)
Coal-water slurry fuel combustion testing in an oil-fired industrial boiler. Semiannual technical progress report, August 15, 1994–February 15, 1995, 20:23034 (R;US)
Development of a coal fired pulse combustor for residential space heating. Technical progress report, April–June 1987, 20:23037 (R;US)
Development of a coal fired pulse combustor for residential space heating. Technical progress report, October–December 1986, 20:23035 (R;US)
Development of a coal fired pulse combustor for residential space heating. Technical progress report, January–March 1987, 20:23036 (R;US)
Development of a coal fired pulse combustor for residential space heating. Technical progress report, July–September 1987, 20:23038 (R;US)
Development of a coal fired pulse combustor for residential space heating: Phase 1-A. Technical progress report, June–August 1988, 20:23039 (R;US)
Emissions reductions in coal-fired home heating stoves through use of briquettes. Quarterly report, January 1, 1995–March 31, 1995, 20:23041 (R;US)
Engineering development of advanced coal-fired low-emission boiler systems. Technical progress report No. 10, January 1995–March 1995, 20:23040 (R;US)
Release of inorganic material during coal devolatilization. Milestone report, 20:23046 (R;US)
Subsidies for promotion of coal production/utilization technology. Second Clean Coal Technology (CCT) Conference, 20:22978 (R;JP;In Japanese)

Combustion Properties
Feasibility study on the environment harmony type coal utilization system. Feasibility study on the environment harmony type coal utilization system in the coal industry sector for China, 20:23022 (R;JP;In Japanese)

Compacting
Coal log pipeline research at the University of Missouri. 1st Quarterly report for 1995, January 1, 1995–March 31, 1995, 20:23026 (R;US)

Consumption Rates
State energy data report 1993: Consumption estimates, 20:23740 (R;US)

Desulfurization
Bio desulfurization of mineral coal, 20:22999 (I;BR;In Portugese)

Devolatilization
Release of inorganic material during coal devolatilization. Milestone report, 20:23046 (R;US)

Drying
An investigation of teh role of water on retrograde/condensation reactions and enhanced liquefaction yields. Final report, 20:22980 (R;US)

Energy Supplies
Planning the mineral coal supply in Brazil: the MOCAM model and its applications, 20:23047 (I;BR;In Portugese)

Environmental Policy
Environmental procedures for thermoelectric power plants by national mineral coal, 20:23020 (R;BR;In Portuguese)

Flotation
Micro-agglomerate flotation for deep cleaning of coal. Quarterly progress report, January 1, 1995–March 31, 1995, 20:22981 (R;US)

Fluidized-Bed Combustion
Clean coal and heavy oil technologies for gas turbines, 20:23027 (RA;US)
Providing solutions to energy and environmental problems. Quarterly technical progress report, January–March 1995, 20:23091 (R;US)
Providing solutions to energy and environmental problems. Quarterly technical progress report, October–December 1994, 20:23090 (R;US)
Second generation pressurized fluidized-bed combustion (PFBC) research and development, Phase 2 – Task 4, carbonizer testing. Volume 1, Test results, 20:23028 (R;US)
Second generation pressurized fluidized-bed combustion (PFBC) research and development, Phase 2 — Task 4, carbonizer testing. Volume 2, Data reconciliation, 20:23029 (R;US)

Fossil-Fuel Power Plants
Environmental procedures for thermoelectric power plants by national mineral coal, 20:23020 (R;BR;In Portuguese)

Leaching
The Speciation of Groundwater Contaminated with Coal Pile Leachate at the Savannah River Site, South Carolina, 20:24616 (R;US)

Mathematical Models
Planning the mineral coal supply in Brazil: the MOCAM model and its applications, 20:23047 (I;BR;In Portugese)

Meetings
Subsidies for promotion of coal production/utilization technology. First Clean Coal Technology Conference, 20:23021 (R;JP;In Japanese)
Subsidies for promotion of coal production/utilization technology. Second Clean Coal Technology (CCT) Conference, 20:22978 (R;JP;In Japanese)

Microbial Leaching
Bio desulfurization of mineral coal, 20:22999 (I;BR;In Portugese)

Molding
Feasibility study on the environment harmony type coal utilization system. Feasibility study on the environment harmony type coal utilization system in the coal industry sector for China, 20:23022 (R;JP;In Japanese)

Nmr Spectra
An investigation of teh role of water on retrograde/condensation reactions and enhanced liquefaction yields. Final report, 20:22980 (R;US)

Planning
Planning the mineral coal supply in Brazil: the MOCAM model and its applications, 20:23047 (I;BR;In Portugese)

Pulse Combustion
Sonic enhanced ash agglomeration and sulfur capture. Technical progress report, January 1995–March 1995, 20:23015 (R;US)

Pyrolysis
Impact of organic-mineral matter interactions on thermal reaction pathways for coal model compounds, 20:22983 (R;US)
Innovative gasification technology for future power generation, 20:22985 (R;US)

Transport
Coal log pipeline research at the University of Missouri. 1st Quarterly report for 1995, January 1, 1995–March 31, 1995, 20:23026 (R;US)

Wear
Coal log pipeline research at the University of Missouri. 1st Quarterly report for 1995, January 1, 1995–March 31, 1995, 20:23026 (R;US)

Weathering
Molecular accessibility in oxidized and dried coals. Quarterly report, January 1995–March 1995, 20:23003 (R;US)

COAL FINES
Combustion characterization of coal fines recovered from the handling plant. Quarterly technical progress report No. 2, January 1, 1995–March 31, 1995, 20:23042 (R;US)
Emission and thermal performance upgrade through advanced control backfit, 20:23012 (RA;US)

COAL GASIFICATION
Innovative gasification technology for future power generation, 20:22985 (R;US)
Providing solutions to energy and environmental problems. Quarterly technical progress report, January–March 1995, 20:23091 (R;US)
Providing solutions to energy and environmental problems. Quarterly technical progress report, October–December 1994, 20:23090 (R;US)
Scale-up of mild gasification to a process development unit. Progress report, November 21, 1994–February 20, 1995, 20:22984 (R;US)

COAL GASIFICATION PLANTS
High-temperature corrosion behavior of iron-aluminide alloys and coatings, 20:23844 (R;US)

COAL INDUSTRY
Coal mining situation in the Federal Republic of Germany. First quarter 1995, 20:23024 (I;DE;In German)
Feasibility study on the environment harmony type coal utilization system. Feasibility study on the environment harmony type coal utilization system in the coal industry sector for China, 20:23022 (R;JP;In Japanese)
US energy industry financial developments, First quarter 1995, 20:23100 (R;US)

COAL LIQUEFACTION
An investigation of teh role of water on retrograde/condensation reactions and enhanced liquefaction yields. Final report, 20:22980 (R;US)
Cooperative Research Program in coal liquefaction. Technical report, May 1, 1994–October 31, 1994, 20:22997 (R;US)
High conversion of coal to transportation fuels for the future with low HC gas production. Progress report Number 10, January 1–March 31, 1995, 20:22995 (R;US)
Impact of organic-mineral matter interactions on thermal reaction pathways for coal model compounds, 20:22983 (R;US)
Microbial recovery of metals from spent coal liquefaction catalysts. Final and quarterly report, July 1994–September 1994, 20:22994 (R;US)
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Final technical report, October 1990–December 1994, 20:22988 (R;US)
Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, October–December 1993, 20:22987 (R;US)

COAL LIQUIDS
Advanced thermally stable jet fuels. Technical progress report, April 1994–June 1994, 20:23002 (R;US)
High conversion of coal to transportation fuels for the future with low HC gas production. Progress report Number 10, January 1–March 31, 1995, 20:22995 (R;US)
Hydrotreating of coal-derived liquids, 20:23000 (R;US)
Refining and end use study of coal liquids. Sixth quarterly technical progress report, December 19, 1994–March 26, 1995, 20:22989 (R;US)

COAL MINING
Branch project mining industry: Development of a system for epidemiological analyses in the occupational medicine (SEPIA). Appendix. SEPIA-AMD manual. Final report, 20:23049 (R;DE;In German)

COAL RANK
Molecular accessibility in oxidized and dried coals. Quarterly report, January 1995–March 1995, 20:23003 (R;US)

COAL SEAMS
Multistrata exploration and production study, 20:23115 (R;US)
Providing solutions to energy and environmental problems. Quarterly technical progress report, October–December 1994, 20:23090 (R;US)
Providing solutions to energy and environmental problems. Quarterly technical progress report, January–March 1995, 20:23091 (R;US)

COAL-DERIVED LIQUIDS

GE SEMICONDUCTOR DETECTORS
See also HIGH-PURITY GE DETECTORS
Apparatus method for correction of the ballistic deficit and charge losses on impurities into germanium detectors, 20:24365 (IA;RU;In Russian)

GEARS
Additional verification problems for HEATING 7.2, 20:25000 (R;US)

GELS
Bridged polysilsesquioxane xerogels: A molecular based approach for the preparation of porous hybrid organic-inorganic materials, 20:23926 (R;US)
Polyelectrolyte gels, 20:23929 (R;US)

GENERAL CIRCULATION MODELS
Accuracy
A comparison of model-simulated relative humidity with satellite-derived cloudiness, 20:24465 (RA;US)
Cloud parameterizations in global climate models: The role of aerosols, 20:24498 (RA;US)
Development of a hybrid cloud parameterization for general circulation models, 20:24488 (RA;US)
Diagnostic analysis of cloud radiative properties, 20:24508 (RA;US)
Air-Biosphere Interactions
Single-column model and cumulus ensemble model simulations of GATE data, 20:24500 (RA;US)
Triggering of boundary layer cumulus clouds over a heterogeneous surface, 20:24504 (RA;US)
Air-Water Interactions
Warm pool physics in a coupled general circulation model, 20:24503 (RA;US)
Algorithms
Radiation impacts on global climate models, 20:24467 (RA;US)
Calculation Methods
Mean fluxes of visible solar radiation in broken clouds, 20:24527 (RA;US)
Clouds
A stratiform cloud parameterization for general circulation models, 20:24480 (RA;US)
Modeling and observing the optical thickness of low clouds, 20:24473 (RA;US)
Comparative Evaluations
Comparison between general circulation model simulation and central equatorial Pacific experiment measurements, 20:24523 (RA;US)
Feedback
Modeling and observing the optical thickness of low clouds, 20:24473 (RA;US)
Forcing Functions
Sensitivity of cirrus cloud radiative properties to ice crystal size and shape in general circulation model simulations, 20:24496 (RA;US)
Optimization
Treatment of cloud radiative effects in general circulation models, 20:24515 (RA;US)
Parametric Analysis
Single-column models as a bridge between observations and climate models, 20:24453 (RA;US)
Performance Testing
Single-column models as a bridge between observations and climate models, 20:24453 (RA;US)
Radiant Heat Transfer
Comparison of stochastic radiation transfer predictions with multi-filter rotating shadowband radiometer data, 20:24470 (RA;US)
Observations from the central equatorial Pacific Experiment and their significance to siting and modeling objectives of the Atmospheric Radiation Measurement Program, 20:24622 (RA;US)

Residual analysis of surface spectral radiances between instrument observations and line-by-line calculations, 20:24471 (RA;US)

Resolution
A comparison of model-simulated relative humidity with satellite-derived cloudiness, 20:24465 (RA;US)
Factors influencing the parameterization of tropical anvils within general circulation models, 20:24469 (RA;US)
Mesoscale simulations of convective systems with data assimilation during June 1993 in the Southern Great Plains, 20:24474 (RA;US)

Sensitivity
Diagnostic analysis of cloud radiative properties, 20:24508 (RA;US)
Factors influencing the parameterization of tropical anvils within general circulation models, 20:24469 (RA;US)
Sensitivity of cirrus cloud radiative properties to ice crystal size and shape in general circulation model simulations, 20:24496 (RA;US)

Sensitivity Analysis
Sensitivity analysis with adjoint of radiation code, 20:24524 (RA;US)

Tropical Regions
Tropical intraseasonal oscillation appearing in operational analyses and in a family of general circulation models, 20:24539 (R;DE)

Validation
Comparison between general circulation model simulation and central equatorial Pacific experiment measurements, 20:24523 (RA;US)

Water Vapor
The role of water vapor and convection during the Central Equatorial Pacific Experiment (CEPEX) from observations and model simulations, 20:24537 (R;DE)

GENERATORS (ELECTRIC)

Hanford 300 Area steam transition preliminary utility options study, 20:23807 (R;US)
Classified Information
Letter to D. R. Harbur, 20:25022 (R;US)
Decisions and Orders
Hanford Action Tracking System release planning support documents, 20:24949 (R;US)
Environmental Impact Statements
Hanford Remedial Action Environmental Impact Statement, Richland, Washington. Implementation Plan, 20:23697 (R;US)
Fuel Reprocessing Plants
Closed loop cooling operation with MICON, 20:23146 (R;US)
PFP Wastewater Sampling Facility, 20:23260 (R;US)
PUREX Plant deactivation mission analysis report, 20:23374 (R;US)
Service of reduction bombs, Plutonium Purification and Fabrication, 234-5 Building, 20:23139 (R;US)
Test plan for anion exchange testing with Argonne 10-L solutions, 20:23147 (R;US)
Fuel Storage Pools
Test procedure for the Master-Lee and the modified Champion four inch hydraulic cutters, 20:23154 (R;US)
Westinghouse Hanford Company recommended strategy for K Basin sludge disposition, 20:23155 (R;US)
Heating Systems
Hanford 300 Area steam transition preliminary utility options study, 20:23807 (R;US)
Low-Level Radioactive Wastes
Statements of work for FY 1996 to 2001 for the Hanford Low-Level Tank Waste Performance Assessment Project, 20:23300 (R;US)
Monitoring
Hanford Sampling Quality Management Plan (HSQMP), 20:23354 (R;US)
Nonradioactive Waste Management
Application of macro material flow modeling to the decision making process for integrated waste management systems, 20:23236 (R;US)
Nuclear Facilities
PFP supply fan motor starters, 20:23373 (R;US)
Nuclear Materials Management
Impact assessment of additional safeguards and security controls on selected nuclides, 20:23388 (R;US)
Occupational Safety
Westinghouse Hanford Company Health and Safety Performance Report. First quarter calendar year 1995, 20:23378 (R;US)
Pipelines
Stress analysis of single port (ISB) jumper connectors for 2-, 3-, and 4-in. sizes, 20:23157 (R;US)
Program Management
Hanford Action Tracking System release planning support documents, 20:24949 (R;US)
Liquid Effluent Monitoring Information System test plans releases 2.0 and 3.0, 20:23309 (R;US)
Radiation Protection
Hanford radiological protection support services annual report for 1994, 20:24726 (R;US)
Radioactive Waste Disposal
Disposal facility data for the interim performance, 20:23303 (R;US)
In situ monitoring of grouted electrolytes, 20:23257 (R;US)
Pre-1970 transuranic solid waste at the Hanford Site, 20:23295 (R;US)
Waste characterization of the 101-SY hydrogen mitigation mixing pump shipping container, 20:23306 (R;US)
Radioactive Waste Facilities
100 Area source operable unit focused feasibility study. Volume 1, 20:23353 (R;US)
Evaluation of remaining life of the double-shell tank waste systems, 20:23291 (R;US)
Radioactive Waste Management
Application of macro material flow modeling to the decision making process for integrated waste management systems, 20:23236 (R;US)
Extrapolation of creep behavior of high-density polyethylene liner in the Catch Basin of grout vaults, 20:23224 (R;US)
Hanford high level waste: Sample Exchange/Evaluation (SEE) Program, 20:23230 (R;US)
Hot sample archiving. Revision 3, 20:23267 (R;US)
Operator coil monitoring acceptance test procedure, 20:23270 (R;US)
Optimization of waste loading in high-level glass in the presence of uncertainty, 20:23231 (R;US)

Review of sensors for the in situ chemical characterization of the Hanford underground storage tanks, 20:23246 (R;US)
Survey package: Technical and contracting strategies for single-shell tank waste retrieval on the Hanford Site, 20:23304 (R;US)
Tank 241-BY-103 vapor sampling and analysis tank characterization report, 20:23288 (R;US)
WHC-SD-W252-FHA-001, Rev. 0: Preliminary fire hazard analysis for Phase II Liquid Effluent Treatment and Disposal Facility, Project W-252, 20:23269 (R;US)
Waste tank headspace gas and vapor characterization reference guide, 20:23290 (R;US)

Radioactive Waste Processing
242-A Evaporator quality assurance plan. Revision 2, 20:23302 (R;US)
CSER 95-005: PFP vertical denitration calciner, 20:23266 (R;US)
Mid-year report: IPC liaison and chemistry of thermal reconstitution, 20:23314 (R;US)
Process control plan for 242-A Evaporator Campaign 95-1, 20:23301 (R;US)
Project C-018H, 242-A evaporator/PUREX Plant Process Condensate Treatment Facility Instrumentation and Control (I&C), 20:23258 (R;US)
Solid waste handling, 20:23308 (R;US)

Radioactive Waste Storage
45-Day safety screen results for Tank 241-C-101, auger sample 95-AUG-019, 20:23275 (R;US)
45-Day safety screen results for Tank 241-U-201, push mode, cores 70, 73 and 74, 20:23274 (R;US)
Analysis of organic carbon and moisture in Hanford single-shell tank waste, 20:23225 (R;US)
Functions and requirements for Hanford single-shell tank leakage detection and monitoring, 20:23299 (R;US)
Hazard categorization and baseline documentation for the Sodium Storage Facility. Revision 1, 20:23263 (R;US)
Ignitability testing for core drilling system. Final report, 20:23310 (R;US)
Moisture monitoring and control system engineering study, 20:23297 (R;US)
Multi-function Waste Tank Facility path forward engineering analysis – Technical Task 3.6, Estimate of operational risk in 200 West Area, 20:23268 (R;US)
Strategy for resolution of the Flammable Gas Safety Issue, 20:23307 (R;US)
Stress evaluation of the primary tank of a double-shell underground storage tank facility, 20:23256 (R;US)
Tank 241-BY-104 vapor sampling and analysis tank characterization report, 20:23281 (R;US)
Tank 241-BY-105 vapor sampling and analysis tank characterization report, 20:23282 (R;US)
Tank 241-BY-106 vapor sampling and analysis tank characterization report, 20:23283 (R;US)
Tank 241-BY-108 vapor sampling and analysis tank characterization report, 20:23284 (R;US)
Tank 241-BY-110 vapor sampling and analysis tank characterization report, 20:23289 (R;US)
Tank 241-C-101 vapor sampling and analysis tank characterization report, 20:23294 (R;US)
Tank 241-C-111 vapor sampling and analysis tank characterization report, 20:23285 (R;US)
Tank 241-C-112 vapor sampling and analysis tank characterization report, 20:23286 (R;US)
Tank waste remediation system: An update, 20:23372 (R;US)

Remedial Action
100 Area source operable unit focused feasibility study. Volume 1, 20:23353 (R;US)
Hanford Remedial Action Environmental Impact Statement, Richland, Washington. Implementation Plan, 20:23697 (R;US)
Hanford Sampling Quality Management Plan (HSQMP), 20:23354 (R;US)
Radioactive Tank Waste Remediation Focus Area. Technology summary, 20:23349 (R;US)
The use of bench- and field-scale data for design of an in situ carbon tetrachloride bioremediation system, 20:24608 (R;US)

Sanitary Landfills
Sodium Dichromate expedited response action assessment. Revision 2, 20:24581 (R;US)

Site Characterization
Geologic, geochemical, microbiologic, and hydrologic characterization at the In Situ Redox Manipulation Test Site, 20:24606 (R;US)

Solid Wastes
Application of macro material flow modeling to the decision making process for integrated waste management systems, 20:23236 (R;US)

Spent Fuel Storage
Characterization of stored defense production spent nulcear fuel and associated materials at Hanford Site, Richland Washington: Environmental assessment, 20:23323 (R;US)

Storage Facilities
Cost benefit and risk assessment for selected tank waste process testing alternatives, 20:23377 (R;US)
Half-liter supernatant sampler system engineering work plan, 20:23313 (R;US)
Multi-function Waste Tank Facility path forward engineering analysis – Technical Task 3.6, Estimate of operational risk in 200 West Area, 20:23268 (R;US)
Radioactive Tank Waste Remediation Focus Area. Technology summary, 20:23349 (R;US)
Stress evaluation of the primary tank of a double-shell underground storage tank facility, 20:23256 (R;US)
Tank waste remediation system: An update, 20:23372 (R;US)
Waste Encapsulation and Storage Facility mission analysis report, 20:23158 (R;US)

Waste Management
Hanford stakeholder participation in evaluating innovative technologies: VOC product line, Passive soil vapor extraction using borehole flux tunable hybrid plasma, 20:23227 (R;US)
Tank Waste Remediation System Guide, 20:23228 (R;US)

Waste Processing Plants
WHC-SD-W252-FHA-001, Rev. 0: Preliminary fire hazard analysis for Phase II Liquid Effluent Treatment and Disposal Facility, Project W-252, 20:23269 (R;US)

Water Pollution
Groundwater monitoring plan for the 300 Area process trenches, 20:23334 (R;US)

Water Treatment Plants
Electrical/instrumentation acceptance test report for Project C-018H, 242-A Evaporator/PUREX Plant condensate treatment facility, 20:23259 (R;US)

HARBORS
Ecological evaluation of proposed dredged material from Richmond Harbor Deepening Project and the intensive study of the Turning Basin, 20:24639 (R;US)
The state-of-the-art port of entry workshop, 20:23769 (R;US)

HARRY EVENT
See NUCLEAR EXPLOSIONS

HARVESTING EQUIPMENT
Develop a field grid system for yield mapping and machine control. Quarterly report, April 1, 1995–June 30, 1995, 20:23417 (R;US)

HAWAII
Environmental resources of selected areas of Hawaii: Climate, ambient air quality, and noise, 20:24546 (R;US)
Environmental resources of selected areas of Hawaii: Ecological resources, 20:23496 (R;US)

HAZARDOUS MATERIALS
See also TOXIC MATERIALS
Bench-scale/field-scale interpretations: Session overview, 20:24705 (R;US)
Decontamination systems information and research program. Quarterly report, January–March 1995, 20:23351 (R;US)
Efficient Separations and Processing Crosscutting Program. Technology summary, 20:23183 (R;US)
Environmental Hazards Assessment Program. Quarterly report, April–June 1995, 20:24731 (R;US)
Environmental guidance regulatory bulletin, 20:23693 (R;US)

Expedited demonstration of molten salt mixed waste treatment technology. Addendum 1, 20:23247 (R;US)
Fate and transport processes controlling the migration of hazardous and radioactive materials from the Area 5 Radioactive Waste Management Site (RWMS), 20:24578 (R;US)
Hazard categorization and baseline documentation for the Sodium Storage Facility. Revision 1, 20:23263 (R;US)
Hazardous waste management in the Pacific basin, 20:23772 (R;US)
Interim-status groundwater monitoring plan for the 216-B-63 trench. Revision 1, 20:23261 (R;US)
Mixed waste focus area alternative technologies workshop, 20:23211 (R;US)
Modelling absorption and dilution of unconfined releases of hazardous gases by water curtains or monitors, 20:24451 (R;US)
Pinellas Plant Annual Site Environmental Report for calendar year 1994, 20:23361 (R;US)
Plasma arc heated secondary combustion chamber, 20:23798 (R;US)
Stress analysis of single port (ISB) jumper connectors for 2-, 3-, and 4-in. sizes, 20:23157 (R;US)
The mixed waste management facility. Project baseline revision 1.2, 20:23248 (R;US)
The societal impact value of risk, 20:24738 (R;US)
University Research Programs in Robotics annual technical progress report, June 1, 1994–May 31, 1995, 20:23982 (R;US)
Using systems analysis to improve decision making in solving mixed waste problems at the Oak Ridge National Laboratory, 20:23176 (R;US)

HAZARDOUS MATERIALS SPILLS
PCB spill response and notification requirements, 20:23692 (R;US)

HD 8077
See NICKEL BASE ALLOYS

HEALTH HAZARDS
Environmental hazards assessment program. Annual report, July 1, 1994–June 30, 1995, 20:24730 (R;US)
Geo-coding of health and demographic data as a resource for environmental incidents preparedness and response, 20:24715 (R;US)

HEALTH PHYSICS
See RADIATION PROTECTION

HEALTH SERVICES
X and gamma rays irradiation tests for evaluating performances of Italian dosimetry services, 20:24719 (R;IT)

HEAT
HSP101 gene from soybean. Progress report, August 16, 1989–August 15, 1992, 20:24681 (R;US)

HEAT EFFECTS
See TEMPERATURE DEPENDENCE

HEAT EXCHANGERS
Interim cryo-cooler/detector report, 20:24376 (R;US)
Testing and plugging power plant heat exchangers, 20:23573 (RA;US)

HEAT PUMPS
Development of two-stage compression heat pump for hot water supply in commercial use. Demonstrated performance of a system applied with vertical shell and tube multifunction intermediate heat exchanger, 20:23776 (R;JP;In Japanese)
New industrial heat pump applications to a synthetic rubber plant. Final report, Phase IIA, 20:23752 (R;US)
Technology assessment of external heat systems for Stirling heat pumps. Final report, 20:23760 (R;US)

HEAT SINKS
DEWPOINT. Final report, 20:24049 (R;US)

HEAT SOURCES
Estimation of district energy saving potential by introduction of district energy supply systems. 1. Development of district energy saving estimation model, 20:23679 (R;JP;In Japanese)

HIGH-LEVEL RADIOACTIVE WASTES

Packaging
Corrosion of candidate materials in Lake Rotokawa geothermal exposure, 20:23930 (R;US)

Pyrochemical Reprocessing
Pyrochemical processing of Idaho Chemical Processing Plant (ICPP) High Level Waste (HLW) calcine, 20:23947 (R;US)

Radioactive Waste Disposal
Tank Focus Area Pretreatment Program. FY 1995 Program Management Plan, 20:23220 (R;US)

Risk Assessment
Methodologies for measurement and application of distribution coefficient, 20:23193 (R;JP;In Japanese)

Road Transport
Nevada potential repository preliminary transportation strategy: Study 1, 20:23326 (R;US)

Roasting
Calcination/dissolution residue treatment, 20:23255 (R;US)

Sampling
Hanford coring bit temperature monitor development testing results report, 20:23241 (R;US)

Transportation Systems
Transportation system requirements document. Revision 1 DCN01. Supplement, 20:23149 (R;US)

Underground Disposal
Anisotropy of mechanical properties of tuff at Yucca Mountain, 20:23173 (R;US)
Continuous, environmental radon monitoring program at the Yucca Mountain Site Characterization Project, 20:23172 (R;US)
Corrosion of candidate materials in Lake Rotokawa geothermal exposure, 20:23930 (R;US)
Determination of water movement in the unsaturated zone at Yucca Mountain using chloride, bromide, and chlorine isotopes as environmental tracers. Final report, 20:23210 (R;US)
Effective transmissivity of two-dimensional fracture networks, 20:23213 (R;US)
Geotechnical characterization of the North Ramp of the Exploratory Studies Facility: Yucca Mountain Site Characterization Project. Volume 2, NRG corehole data appendices (Yucca Mountain Project), 20:23239 (R;US)
Geotechnical characterization of the North Ramp of the Exploratory Studies Facility: Yucca Mountain Site Characterization Project. Volume 1, Data summary, 20:23238 (R;US)
Ground-water altitudes and well data, Nye County, Nevada, and Inyo County, California, 20:23253 (R;US)
Long-term test results from a West Valley actinide-doped reference glass, 20:23163 (R;US)
Physical model simulation for resistivity tomography. An experimental tank and detection limit for a pole-pole array, 20:24589 (R;JP;In Japanese)
Selection of a preferred initial access for the exploratory studies facility, 20:23207 (R;US)
Technical Data Catalog: Yucca Mountain Site Characterization Project. Quarterly supplement, 20:23186 (R;US)
Weathering products of basic rocks as sorptive materials of natural radionuclides, 20:23214 (R;US)
Yucca Mountain Site Characterization Project technical data catalog quarterly supplement, 20:23185 (R;US)

Underground Storage
Hanford coring bit temperature monitor development testing results report, 20:23241 (R;US)
Nevada potential repository preliminary transportation strategy: Study 1, 20:23326 (R;US)
Nondestructive examination of DOE high-level waste storage tanks, 20:23170 (R;US)
Tank Waste Remediation System Guide, 20:23228 (R;US)

Vitrification
Laboratory testing of LITCO glasses, 20:23901 (R;US)
Laboratory testing of West Valley reference 6 glass, 20:23160 (R;US)
Long-term test results from a West Valley actinide-doped reference glass, 20:23163 (R;US)
New glass material oxidation and dissolution system facility: Direct conversion of surplus fissile materials, spent nuclear fuel, and other material to high-level-waste glass. Storage and disposition of weapons-usable fissile materials programmatic environmental impact statement data report: Predecisional draft, 20:23386 (R;US)
Optimization of waste loading in high-level glass in the presence of uncertainty, 20:23231 (R;US)
Performance of high plutonium-containing glasses for the immobilization of surplus fissile materials, 20:23162 (R;US)
Performance testing of West Valley Reference 6 glass, 20:23899 (R;US)
Quantitative SEM/EDS analysis of high-level waste glasses, 20:23165 (R;US)
The corrosion behavior of DWPF glasses, 20:23900 (R;US)

Waste Management
Efficient Separations and Processing Crosscutting Program. Technology summary, 20:23183 (R;US)

HIGH-PURITY GE DETECTORS
Apparatus and method for detecting gamma radiation, 20:24371 (PA;US)
Monte Carlo study of a high-sensitivity gamma-ray detection system, 20:24375 (R;US)

HIGH-TC SUPERCONDUCTORS
High-temperature superconducting transformer evaluation, 20:23658 (R;US)
High-temperature superconductor current leads for electric utility SMES applications, 20:23665 (R;US)
Relationships between processing temperature and microstructure in isothermal melt processed Bi-2212 thick films, 20:23894 (R;US)

HIGH-VOLTAGE PULSE GENERATORS
High-voltage pulse generator based on inductive-coupled circuits, 20:24225 (IA;RU;In Russian)

HIGHLY ENRICHED URANIUM
HEU age determination, 20:23381 (R;US)
HEU to LEU fuel conversion. Final report, 20:23131 (R;US)
Nonproliferation and safeguards aspects of fuel cycle programs in reduction of excess separated plutonium and high-enriched uranium, 20:23543 (R;US)
Nuclear nonproliferation: Concerns with US delays in accepting foregin research reactors' spent fuel, 20:23828 (R;US)

Yakima Fisheries Project revised Draft Environmental Impact Statement: Summary, 20:23452 (R;US)
Yakima Fisheries Project: Revised draft environmental impact statement, 20:23465 (R;US)
Yakima fisheries project. Revised draft environmental impact statement, 20:23464 (R;US)
HYDROGEN
Autoignition of hydrogen under direct-injection compression-ignition engine conditions, 20:23810 (R;US)
Collisions of negative muons and hadrons with metastable atoms, 20:24840 (IA;RU)
Detailed and global chemical kinetics model for hydrogen, 20:23416 (R;US)
Dynamics of inelastic and reactive gas-surface collisions, 20:23963 (R;US)
Hydrogen chemisorption on diamond surfaces. Final report, 20:23968 (R;US)
Hydrogen fuel dispensing station for transportation vehicles, 20:23819 (R;US)
Hydrogen program combustion research: Three dimensional computational modeling, 20:23415 (R;US)
Improvement of hydrogen solubility and entrainment in hydrocracker feedstocks. Quarterly technical report, January 1, 1995–March 31, 1995, 20:23094 (R;US)
Nanoindentation and nanoscratching of hard carbon coatings for magnetic disks, 20:23906 (R;US)
Quantum theory of chemical reaction rates, 20:23962 (R;US)
Structure and composition of clean and hydrogen covered MoRe surfaces, 20:23843 (R;US)
Temperature measurements of shock-compressed deuterium, 20:24910 (R;US)
HYDROGEN 2
See DEUTERIUM
HYDROGEN 3
See TRITIUM
HYDROGEN FUEL CELLS
Characterization of PEM fuel cell membrane-electrode-assemblies by electrochemical methods and microanalysis, 20:23747 (R;US)
Direct-hydrogen-fueled proton-exchange-membrane (PEM) fuel cell system for transportation applications. Quarterly technical progress report Number 1, July 1–September 30, 1994, 20:23813 (R;US)
HYDROGEN FUELS
A smooth transition to hydrogen transportation fuel, 20:23824 (R;US)
Fuel cell systems for first lunar outpost – Reactant storage options, 20:23745 (R;US)
The green hydrogen report. The 1995 progress report of the Secretary of Energy's Hydrogen Technical Advisory Panel, 20:23413 (R;US)

HYDROGEN HYDROXIDES
See WATER
HYDROGEN IONS 1 MINUS
Electron energy spectra of H^- autodetaching states resulting from collisions of H^- with He at 1 keV, 20:24838 (R;US)
Penning trap and resistive cooling of protons. Final technical report, May 1993–March 1995, 20:24834 (R;US)
HYDROGEN NITRATES
See NITRIC ACID
HYDROGEN STORAGE
The emerging roles of energy storage in a competitive power market: Summary of a DOE Workshop, 20:23664 (R;US)
HYDROGEN SULFIDES
Membrane process for separating H_2S from natural gas, 20:23116 (R;US)
Microbially-enhanced redox solution reoxidation for sweetening sour natural gas, 20:23119 (R;US)
Production of elemental sulfur and methane from H_2S and CO_2 derived from a coal desulfurization process. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:23001 (R;US)
HYDROGEN-BASED ECONOMY
Climate-compatible energy supply in Baden-Wuerttemberg. Photovoltaic energy conversion - imports of solar electricity - hydrogen, 20:23486 (I;DE;In German)
HYDROLOGY
Effective transmissivity of two-dimensional fracture networks, 20:23213 (R;US)
HYDROPEROXY RADICALS
OH generation in steam-air pulsed corona, 20:24553 (R;US)
HYDROXYBENZENE
See PHENOL
HYDROXYL RADICALS
OH generation in steam-air pulsed corona, 20:24553 (R;US)
HYFLEX PROCESS
See COAL GASIFICATION
HYPERONS
Coherent production of e^+ particles in crystal using proton beam from SSC, 20:24803 (R;US)
HYPERSONIC FLOW
Monthly technical progress report, May 29, 1995–July 2, 1995, 20:23558 (R;US)

I

I-BEAM TYPE REACTORS
See ION BEAM FUSION REACTORS
IAEA
IAEA workshop and field trial at the Oak Ridge K-25 Site, 20:24590 (R;US)
IAEA SAFEGUARDS
Basic visual observation skills training course. Final report, 20:23391 (R;US)
Basic visual observation skills training course: Appendix A. Final report, 20:23392 (R;US)
Basic visual observation skills training course: Appendix B. Final report, 20:23393 (R;US)
IBR-30 REACTOR
Proposal on construction of high-current racetrack accelerator as an electron injector for a multipurpose breeding target, 20:24087 (IA;RU;In Russian)
ICE
Sensitivity of cirrus cloud radiative properties to ice crystal size and shape in general circulation model simulations, 20:24496 (RA;US)
The effects of arctic stratus clouds on the solar energy budget in the atmosphere-sea ice-ocean system, 20:24487 (RA;US)
ICF DEVICES
Diode-pumped solid state laser for inertial fusion energy, 20:24914 (R;US)
Environmental aspects of prospective energy generation by the inertial confinement fusion process. Pt. A. DT fusion, 20:24888 (R;DE;In German)
NIF target fill, transport and insertion cryostat, 20:24909 (R;US)
National Ignition Facility design, performance, and cost, 20:24922 (R;US)
The National Ignition Facility Project. Revision 1, 20:24917 (R;US)
ICR HEATING
Fast wave current drive modeling using the combined RANT3D and PICES codes, 20:24859 (R;US)
IDAHO
The Beaverhead impact structure, SW Montana and Idaho: Implications for the regional geology of the western U.S., 20:24753 (R;US)
IDAHO NATIONAL ENGINEERING LABORATORY
Consultant subcontracting at the Idaho National Engineering Laboratory, 20:23404 (R;US)
Cost Quality Management Assessment for the Idaho Operations Office. Final report, 20:24932 (R;US)
Inventory of site-derived ^{36}Cl in the Snake River plain aquifier, Idaho National Engineering Laboratory, Idaho, 20:23189 (R;US)
Radioactive Tank Waste Remediation Focus Area. Technology summary, 20:23349 (R;US)
IDENTIFICATION SYSTEMS
Accelerated aging studies and environmental stability of prototype tamper tapes, 20:23921 (R;US)
ILLUMINATION SYSTEMS
See LIGHTING SYSTEMS
IMAGE PROCESSING
Development of animation processing system, 20:24991 (R;JP;In Japanese)
Parallel sphere rendering, 20:24997 (R;US)
IMAGE SCANNERS
An analog edge detector with simultaneous background suppression, 20:24388 (PA;US)
IMPACT SHOCK
Modeling the dynamic crush of impact mitigating materials, 20:24012 (R;US)
IMPLANTED SOURCES
See RADIATION SOURCE IMPLANTS
IMPULSE
See PULSES
IN-CORE THERMIONIC REACTOR
See ZERO POWER REACTORS
IN-SITU PROCESSING
Readiness review plan for the in situ vitrification demonstration of Seepage Pit 1 in Waste Area Grouping 7, 20:23216 (R;US)
INCIDENTS
See ACCIDENTS
INCINERATION
See COMBUSTION
INCINERATORS
Summary report of incineration plenum fire: Building 771, July 2, 1980, 20:23367 (R;US)
INCOMPLETE FUSION REACTIONS
A high charge state heavy ion beam source for HIF, 20:24903 (R;US)
INCOMPRESSIBLE FLOW
Velocity boundary conditions for vorticity formulations of the incompressible Navier-Stokes equations, 20:24770 (R;US)
INCONEL 600
Stress corrosion cracking behavior of Alloy 600 in high temperature water, 20:23879 (R;US)
INCONEL 625
Irradiation-assisted stress corrosion cracking of HTH Alloy X-750 and Alloy 625, 20:23878 (R;US)
Robotic weld overlay coatings for erosion control. Quarterly technical progress report, January 1995–March 1995, 20:23852 (R;US)
INCONEL 713C
Fatigue life prediction for integrally cast turbine wheels while taking into account short cracks using the nickel base alloy IN 713 C as an example, 20:23863 (IA;DE;In German)
INCONEL X750
Irradiation-assisted stress corrosion cracking of HTH Alloy X-750 and Alloy 625, 20:23878 (R;US)

INDIAN POINT-2 REACTOR
BNL ALARA Center: ALARA Notes, No. 9, 20:23535 (R;US)
INDIANS (AMERICAN)
See AMERICAN INDIANS
INDICATOR SPECIES
See BIOLOGICAL INDICATORS
INDIUM ALLOYS
Landau-Ginzburg model of interphase boundaries in CsCl-type ferroelastics due to M^{-}_{5} mode instability: $LaAg_{1-x}In_x$, 20:23860 (R;US)
INDIUM ARSENIDES
Defect studies in thin film III-V thin film semiconductors. Progress report, September 1986–May 1987, 20:23909 (R;US)
Nucleation, propagation, electronic levels and elimination of misfit dislocations in III-V semiconductor interfaces. Final report, September 1, 1986–August 31, 1993, 20:23910 (R;US)
[Structure and electronic properties of defects at nonlattice matched III-V semiconductor interfaces]. Progress report, 1989–90, 20:24035 (R;US)
INDIUM NITRIDES
High rate ECR etching of III-V nitride materials, 20:23923 (R;US)
INDIUM SELENIDE SOLAR CELLS
Numerical modeling of $CuInSe_2$ and CdTe solar cells. Annual subcontract report, March 1, 1994–February 28, 1995, 20:23478 (R;US)
Research on high-efficiency, large-area $CuInSe_2$-based thin-film modules. Final subcontract report, 16 August 1993–30 June 1995, 20:23476 (R;US)
INDIUM SELENIDES
Numericl modeling of graded band gap CIGS solar cells, 20:23467 (R;US)
INDONESIA
Hazardous waste management in the Pacific basin, 20:23772 (R;US)
INDUCTION GENERATORS
The pulsed linear induction motor concept for high-speed trains, 20:23770 (R;US)
INDUSTRIAL MEDICINE
Oak Ridge Institute for Science and Education, Medical Sciences Division report for 1994, 20:24725 (R;US)
INDUSTRIAL PLANTS
See also COAL GASIFICATION PLANTS
FEED MATERIALS PLANTS
ISOTOPE SEPARATION PLANTS
METHANOL PLANTS
WASTE PROCESSING PLANTS
EUV lithography cost of ownership analysis, 20:24055 (R;US)
New industrial heat pump applications to a synthetic rubber plant. Final report, Phase IIA, 20:23752 (R;US)
INDUSTRIAL SECTOR

Interaction of fast waves with ions, 20:24865 (R;US)
IPNS-I SYNCHROTRON
Study of corrections to the geometrical factor in the space charge impedance for the IPNS upgrade, 20:24141 (R;US)
Study of synchro-betatron coupling in IPNS upgrade RCS, 20:24140 (R;US)
IPP GARCHING
Max-Planck-Institut fuer Plasmaphysik. Annual report 1994, 20:24889 (I;DE)
IRIDIUM
US Department of Energy Office of Inspector General report on audit of the Department of Energy's management of precious metals, 20:24427 (R;US)
IRIDIUM ALLOYS
Thermoelectric material development. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:23743 (R;US)
IRON
Calcination/dissolution residue treatment, 20:23255 (R;US)
Development of precipitated iron Fischer-Tropsch catalysts. Quarterly technical progress report, 1 January 1995–31 March 1995, 20:22998 (R;US)
Oil production enhancement through a standardized brine treatment. Final report, 20:23101 (R;US)
IRON ALLOYS
See also IRON BASE ALLOYS
Magnetic Compton scattering studies of the Invar alloy Fe_3Pt, 20:23835 (R;US)
Revitalize the US silicon/ferrosilicon industry through energy-efficient technology. Part 1, Final report, 20:23777 (R;US)
IRON BASE ALLOYS
See also STEELS
Energy-filtered imaging of precipitates in FeCuN alloys, 20:23848 (R;US)
High-temperature corrosion behavior of iron-aluminide alloys and coatings, 20:23844 (R;US)
Mechanically reliable surface oxides for high-temperature corrosion resistance, 20:23832 (R;US)
Pack cementation diffusion coatings for iron-base alloys, 20:23865 (R;US)

IRON CARBIDES
Magnetic thin films formed in a glow discharge. Final report, 20:23778 (R;US)
IRON COMPLEXES
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 6, January 16, 1988–April 15, 1988, 20:23440 (R;US)
The synthesis and characterization of new iron coordination complexes utilizing an asymmetric coordinating chelate ligand, 20:23434 (R;US)
IRON COMPOUNDS
See also FERRITES
IRON CARBIDES
IRON OXIDES
The release of iron during coal combustion. Milestone report, 20:23043 (R;US)
IRON OXIDES
Processing & properties $La_{1-x}A_xCo_{1-y}Fe_yO_3$(A = Sr, Ca) perovskites, 20:23895 (R;US)
IRRADIATION CAPSULES
HRB-22 preirradiation thermal analysis, 20:23604 (R;US)
Remote disassembly of irradiated tritium-bearing lithium-bonded capsules, 20:23975 (R;US)
IRRADIATION PROCEDURES
Neutron spectral tailoring calculation in the JMTR. Feasible study on irradiation test simulating the fusion reactor condition, 20:24893 (R;JP;In Japanese)
Neutronics analysis on helium production control in stainless steel by neutron spectral tailoring in the JMTR, 20:23603 (R;JP;In Japanese)
IRRIGATION
Energetic parameters to be considered in the preparation of irrigation programs for the district of Santa Terezinha, Mato Grosso do Sul state, Brazil, 20:23735 (I;BR;In Portugese)
ISOCHRONOUS CYCLOTRONS
Acceleration of heavy ion beams at the IYaF AN RK cyclotron, 20:24071 (IA;RU;In Russian)
Calculation of an vacuum system of an accelerator of H^- ion intense beams, 20:24227 (IA;RU;In Russian)
Magnetic system of the U-115T isochronous cyclotron, 20:24233 (IA;RU;In Russian)
Method of radioactive nuclei acceleration using one accelerator, 20:24076 (IA;RU;In Russian)
Project of a heavy accelerating complex, 20:24073 (IA;RU;In Russian)
Status of construction of the Kurchatov Institute MGTs-10 small-sized cyclotron, 20:24074 (IA;RU;In Russian)
ISOTOPE ENRICHMENT
See ISOTOPE SEPARATION
ISOTOPE SEPARATION
Digital simulation of an enrichment process for solutions by means of an advection-diffusion chamber, 20:24988 (I;UY;In Spanish)
Sequential method for the assessment of innovations in computer assisted industrial processes, 20:24989 (I;UY;In Spanish)
ISOTOPE SEPARATION PLANTS
Project management plan for the Isotopes Facilities Deactivation Project at Oak Ridge National Laboratory. Environmental Restoration Program, 20:23410 (R;US)
ISOTOPIC SEPARATION

WAKEFIELD ACCELERATORS
Proceedings of the 13. workshop on charged particle accelerators. Volume 1, 20:24066 (I;RU;In Russian)

Accelerator Facilities
Rig for study on ion dynamics in RF quadrupole focusing accelerating, 20:24088 (IA;RU;In Russian)

Beam Bunching
Optimization criteria for standing wave transverse magnetic deflection cavities, 20:24184 (R;US)
Wakefield suppression using beatwave structures, 20:24109 (R;US)

Beam Focusing Magnets
Positron focusing in the Advanced Photon Source (APS) linear accelerator, 20:24165 (R;US)

Beam Monitoring
Bunch length measurements at the Advanced Photon Source (APS) linear accelerator, 20:24163 (R;US)

Beam Monitors
Performance of the advanced photon source (APS) linac beam position monitors (BPMs) with logarithmic amplifier electronics, 20:24170 (R;US)

Beam Profiles
Application of a transverse phase-space measurement technique for high-brightness, H^- beams to the GTA H^- beam, 20:24759 (R;US)

Colliding Beams
Development and performance testing of elements of power RF systems of linear electron-positron colliders, 20:24202 (IA;RU;In Russian)
Free electron laser for the 2 x 1 TeV photon collider, 20:24068 (IA;RU;In Russian)

Deformation
Results of calculation of thermoelastic deformations of UNK injection system 'URAL-60' linac accelerating structures, 20:24311 (IA;RU;In Russian)

Electron Beam Injection
Optimization criteria for standing wave transverse magnetic deflection cavities, 20:24184 (R;US)

Electron Beams
Off gas cleaning by electron beam. The mobile test facility AGATE-M, 20:24541 (R;DE;In German)

Focusing
Rig for study on ion dynamics in RF quadrupole focusing accelerating, 20:24088 (IA;RU;In Russian)

Frequency Control
Methods of minimization of frequency shift in accelerating structures at power input into an accelerator, 20:24080 (IA;RU;In Russian)

Meson Factories
Electrodynamic characteristics of accelerating structure of the Moscow meson factory radionuclide linear accelerator (LURAN), 20:24075 (IA;RU;In Russian)

Multicharged Ions
Electrodynamic characteristics of accelerating structure of the Moscow meson factory radionuclide linear accelerator (LURAN), 20:24075 (IA;RU;In Russian)

Photon Beams
Free electron laser for the 2 x 1 TeV photon collider, 20:24068 (IA;RU;In Russian)

Positioning
Precise drive for the electron-positron linear collider elements positioning system, 20:24192 (IA;RU;In Russian)

Rf Systems
Low-field permanent magnet quadrupoles in a new relativistic-klystron two-beam accelerator design, 20:24245 (RA;US)

Superconducting Magnets
A high gradient superconducting quadrupole for a low charge state ion linac, 20:24174 (R;US)

Temperature Control
Results of calculation of thermoelastic deformations of UNK injection system 'URAL-60' linac accelerating structures, 20:24311 (IA;RU;In Russian)

Thermal Neutrons
Proposal on construction of high-current racetrack accelerator as an electron injector for a multipurpose breeding target, 20:24087 (IA;RU;In Russian)

LINEAR COLLIDERS
Investigation of the beam impedance of a slowly varying waveguide, 20:24283 (R;US)
Loaded delay lines for future RF pulse compression systems, 20:24282 (R;US)
Optimization of the NLC final focus system, 20:24144 (R;US)

LINERS
Eddy current and quench loads and stress of SSC collider 4-K liner and the bore tube during magnet quench, 20:24291 (R;US)
Extrapolation of creep behavior of high-density polyethylene liner in the Catch Basin of grout vaults, 20:23224 (R;US)

Electromagnetic mixed-waste processing system for asbestos decontamination, 20:23184 (R;US)
Evaluation of the freeze-thaw/evaporation process for the treatment of produced waters. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:23104 (R;US)
Grain size dependent mechanical properties in nanophase materials, 20:23834 (R;US)
Integrated chemical/biological treatment of paint stripper mixed waste: Metals toxicity and separation, 20:23360 (R;US)
Method and apparatus for analyzing eddy-current test measurements, 20:24399 (PA;US)
Monitoring of MOCVD reactants by UV absorption, 20:23866 (R;US)
The use of capacitive deionization with carbon aerogel electrodes to remove inorganic contaminants from water, 20:23949 (R;US)

METEORITES
The Beaverhead impact structure, SW Montana and Idaho: Implications for the regional geology of the western U.S., 20:24753 (R;US)

METHANE
Biosynthesis
Microbiology and physiology of anaerobic fermentation of cellulose. Annual report for 1990, 1992, 1993 and final report, 20:23419 (R;US)

Chemical Reaction Yield
Effect of temperature on perchloroethylene dechlorination by a methanogenic consortium, 20:24607 (R;US)
Production of elemental sulfur and methane from H_2S and CO_2 derived from a coal desulfurization process. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:23001 (R;US)

Chlorination
Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 11, April–June 1994, 20:23959 (R;US)
Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 12, July–September 1994, 20:23960 (R;US)
Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 10, January 1944–March 1994, 20:23958 (R;US)
Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 8, July–September 1993, 20:23957 (R;US)

Combustion
A study of NO_x reduction by fuel injection recirculation. Topical report, January 1995–May 1995, 20:23127 (R;US)

Conversion
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 8, July 16–September 30, 1988, 20:23442 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 2, January 16, 1987–April 15, 1987, 20:23436 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 7, April 16, 1988–July 15, 1988, 20:23441 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 1, October 16, 1986–January 15, 1987, 20:23435 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 5, November 16, 1987–January 15, 1988, 20:23439 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 9, October 1–December 31, 1988, 20:23443 (R;US)

Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 3, April 16–July 15, 1987, 20:23437 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 4, August 16–October 15, 1987, 20:23438 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 6, January 16, 1988–April 15, 1988, 20:23440 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 10, January 1–March 31, 1989, 20:23444 (R;US)
Transient studies of low temperature catalysts for methane conversion. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:22996 (R;US)

Energy Source Development
Climate-compatible power supply in Baden-Wuerttemberg - energy from agricultural and forestry biomass, 20:23425 (I;DE;In German)

Materials Recovery
Providing solutions to energy and environmental problems. Quarterly technical progress report, October–December 1994, 20:23090 (R;US)
Providing solutions to energy and environmental problems. Quarterly technical progress report, January–March 1995, 20:23091 (R;US)

Meetings
Intergas '95: International unconventional gas symposium. Proceedings, 20:23112 (R;US)

Oxidation
Direct catalytic conversion of methane and light hydrocarbon gases. Final report, October 1, 1986–July 31, 1989, 20:22986 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 6, January 16, 1988–April 15, 1988, 20:23440 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 7, April 16, 1988–July 15, 1988, 20:23441 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 3, April 16–July 15, 1987, 20:23437 (R;US)
Fundamental studies of the mechanism of catalytic reactions with catalysts effective in the gasification of carbon solids and the oxidative coupling of methane. Quarterly report, January 1, 1995–March 31, 1995, 20:23445 (R;US)
Selective methane oxidation over promoted oxide catalysts. Quarterly report, December 1994–February 1995, 20:23433 (R;US)
The synthesis and characterization of new iron coordination complexes utilizing an asymmetric coordinating chelate ligand, 20:23434 (R;US)

Pyrolysis
Direct aromatization of methane. Quarterly technical progress report No. 9, October 1, 1994–December 31, 1994, 20:22993 (R;US)

METHANOL
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 6, January 16, 1988–April 15, 1988, 20:23440 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 3, April 16–July 15, 1987, 20:23437 (R;US)
Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 1, October 16, 1986–January 15, 1987, 20:23435 (R;US)
Report of liquid fuel conversion technology development. Feasibility survey on liquid fuel conversion, 20:23120 (R;JP;In Japanese)
Selective methane oxidation over promoted oxide catalysts. Quarterly report, December 1994–February 1995, 20:23433 (R;US)
The synthesis and characterization of new iron coordination complexes utilizing an asymmetric coordinating chelate ligand, 20:23434 (R;US)

METHANOL FUELS
Atmospheric process evaluation of mobile source emissions, 20:23821 (R;US)
Report of the fiscal 1993 liquid fuel conversion technology development. Development for Practical application of a new production process, 20:23432 (R;JP;In Japanese)

METHANOL PLANTS

OIL SPILLS
Applying automated data acquisition and management technology to bioremediation, 20:23315 (R;US)
Identification of oil spill's sources, 20:23105 (R;IT;In Italian)

OIL WELLS
Brines
Oil production enhancement through a standardized brine treatment. Final report, 20:23101 (R;US)
Carbon Dioxide Injection
Post waterflood CO_2 miscible flood in light oil fluvial dominated deltaic reservoirs. Second quarterly technical progress report, [January 1, 1995–March 31, 1995], 20:23085 (R;US)
Post waterflood CO_2 miscible flood in light oil, fluvial-dominated deltaic reservoir. Annual report, October 1, 1993–September 30, 1994, 20:23084 (R;US)
Combustion
Measurement of polynuclear aromatic hydrocarbon concentrations in the plume of Kuwait oil well fires, 20:23107 (R;US)
Directional Drilling
Productivity and injectivity of horizontal wells. Annual report for the period, March 10, 1994–March 9, 1995, 20:23071 (R;US)
Fluid Injection
Surfactant loss control in chemical flooding spectroscopic and calorimetric study of adsorption and precipitation on reservoir minerals. Annual report, September 30, 1993–September 30, 1994, 20:23074 (R;US)
Gas Injection
West Hackberry Tertiary Project. Quarterly technical progress report, March 3, 1995–June 2, 1995, 20:23087 (R;US)
Hydraulic Fracturing
Fracturing Fluid Characterization Facility (FFCF): Recent advances, 20:23118 (R;US)
Production
An integrated study of the Grayburg/San Andres Reservoir, Foster and South Cowden Fields, Ector County, Texas. Quarterly technical progress report No. 3, February 1, 1995–April 30, 1995, 20:23062 (R;US)
Productivity
Productivity and injectivity of horizontal wells. Annual report for the period, March 10, 1994–March 9, 1995, 20:23071 (R;US)
Steam Injection
Visualization and simulation of immiscible displacement in fractured systems using micromodels: Steam injection, 20:23079 (R;US)
Waste Water
Characterization of oil and gas waste disposal practices and assessment of treatment costs. Final report, 20:23092 (R;US)
Geologic, geochemical, and geographic controls on NORM in produced water from Texas oil, gas, and geothermal reservoirs. Final report, 20:23093 (R;US)
Wetland treatment of oil and gas well waste waters. Final report, 20:23103 (R;US)
Waterflooding
An experimental and theoretical study to relate uncommon rock/fluid properties to oil recovery. Final report, 20:23070 (R;US)
An integrated study of the Grayburg/San Andres Reservoir, Foster and South Cowden Fields, Ector County, Texas. Quarterly technical progress report No. 3, February 1, 1995–April 30, 1995, 20:23062 (R;US)
Development of cost-effective surfactant flooding technology. Annual report for the period, September 30, 1993–September 29, 1994, 20:23075 (R;US)
Electrical and electromagnetic methods for reservoir description and process monitoring. Annual report, October 1, 1991–September 30, 1992, 20:23065 (R;US)
Improved oil recovery in fluvial dominated deltaic reservoirs of Kansas – near-term. Seventh quarterly report, February 1, 1995–April 1, 1995, 20:23083 (R;US)
Synthetic drilling muds: Environmental gain deserves regulatory recognition, 20:23068 (R;US)
The utilization of the microflora indigenous to and present in oil-bearing formations to selectively plug the more porous zones thereby increasing oil recovery during waterflooding. Annual report for the period, January 1, 1994–December 31, 1994, 20:23086 (R;US)

OLEFINS

PORTS
See HARBORS

PORTSMOUTH GASEOUS DIFFUSION PLANT
Calculated in-air leakage spectra and power levels for the ANSI standard minimum accident of concern. Final report, 20:23130 (R;US)
Environmental restoration risk-based prioritization work package planning and risk ranking methodology. Revision 2, 20:23357 (R;US)

POSITION SENSITIVE DETECTORS
Position sensitive neutron scintillation detectors for use at various european neutron sources, 20:24358 (IA;RU)

POSITRON BEAMS
Positron focusing in the Advanced Photon Source (APS) linear accelerator, 20:24165 (R;US)

POSITRON-ELECTRON-PROTON STORAGE RING
See PEP STORAGE RINGS

POST-IRRADIATION EXAMINATION
Post irradiation examinations of uranium-plutonium mixed nitride fuel irradiated in JMTR (88F-5A capsule), 20:23579 (R;JP;In Japanese)

POTASSIUM
Development of precipitated iron Fischer-Tropsch catalysts. Quarterly technical progress report, 1 January 1995–31 March 1995, 20:22998 (R;US)

POTASSIUM OXIDES
Investigation of optical loss mechanisms in oxide thin films, 20:23905 (R;US)

POTENTIAL (ELECTRIC)
See ELECTRIC POTENTIAL

POTT-BROCHE PROCESS
See COAL LIQUEFACTION

POWER DISTRIBUTION
Present status and forecast of T&D facilities, 20:23645 (RA;US)

POWER DISTRIBUTION SYSTEMS
A microprocessor-based digital feeder monitor with high-impedance fault detection, 20:23648 (RA;US)
BPA/Puget Power Northwest Washington Transmission Project. Final Environmental Impact Statement, 20:23662 (R;US)
Fisher Pierce products for improving distribution system reliability, 20:23647 (RA;US)
Long range planning in electric power distribution systems, 20:23641 (I;BR;In Portugese)
Refurbish power supply/distribution system Phase II. Progress status report No. 43, March 1, 1995–March 31, 1995, 20:23655 (R;US)
The value of distributed generation: The PVUSA grid-support project serving Kerman Substation. Interim report, April 1994, 20:23654 (R;US)
World-wide distribution automation systems, 20:23649 (RA;US)

POWER GENERATION
See also COGENERATION
An architecture for an intelligent automatic generation control for electric power systems, 20:23639 (RA;US)

POWER PLANTS
See also DUAL-PURPOSE POWER PLANTS
GAS TURBINE POWER PLANTS
HYDROELECTRIC POWER PLANTS
SOLAR POWER PLANTS
THERMAL POWER PLANTS

THERMONUCLEAR POWER PLANTS
WIND POWER PLANTS
Decision-making in demand-side management collaboratives: The influence of non-utility parties on electric-utility policies and programs, 20:23728 (R;US)
The plant-window system, 20:23514 (R;US)

POWER POOLS
See INTERCONNECTED POWER SYSTEMS

POWER SUBSTATIONS
Intelligent devices simplify remote SCADA installations in substations, 20:23646 (RA;US)

POWER SUPPLIES
See also PHOTOVOLTAIC POWER SUPPLIES
Charge exchange injection system kicker magnets pulse power supply, 20:24230 (IA;RU;In Russian)
Design of kicker magnet and power supply unit for synchrotron beam injection, 20:24253 (R;US)
Direct current stabilizers for supplying magnet coils of iron-core current channel of the JINR phasotron, 20:24232 (IA;RU;In Russian)
Power supplies for the injector synchrotron quadrupoles and sextupoles, 20:24257 (R;US)
Power supply control units for APS ring magnets, 20:24258 (R;US)

POWER SYSTEMS
See also AC SYSTEMS
DC SYSTEMS
INTERCONNECTED POWER SYSTEMS
A microprocessor-based digital feeder monitor with high-impedance fault detection, 20:23648 (RA;US)
Fisher Pierce products for improving distribution system reliability, 20:23647 (RA;US)
Intelligent devices simplify remote SCADA installations in substations, 20:23646 (RA;US)
Refurbish power supply/distribution system Phase II. Progress status report No. 43, March 1, 1995–March 31, 1995, 20:23655 (R;US)
World-wide distribution automation systems, 20:23649 (RA;US)

POWER TRANSMISSION
Dynamic preventive control in electric power systems, 20:23642 (I;BR;In Portugese)
Long term planning for expansion of electric energy transmission systems with restriction of transient stability using the concept of potential energy boundary surface, 20:23643 (I;BR;In Portugese)
Present status and forecast of T&D facilities, 20:23645 (RA;US)
Summary report on the project to develop recommendations on effective linkages between state IRP, facility siting and regional transmission planning in a competitive environment. Final report, May 24, 1994–March 31, 1995, 20:23637 (R;US)

POWER TRANSMISSION LINES
Bulk power system performance issues affecting utility peaking capacity additions, 20:23660 (RA;US)

POWER TRANSMISSION TOWERS
Summary report on the project to develop recommendations on effective linkages between state IRP, facility siting and regional transmission planning in a competitive environment. Final report, May 24, 1994–March 31, 1995, 20:23637 (R;US)

PRECIPITATIONS (ATMOSPHERIC)
See ATMOSPHERIC PRECIPITATIONS

PREDATOR-PREY INTERACTIONS
Exactly conservative integrators, 20:24980 (R;US)

PRESSURE (PLASMA)
See PLASMA PRESSURE

PRESSURE VESSELS
APS storage ring vacuum chamber tests for dimensional stability after bakeout cycling while under vacuum, 20:24250 (R;US)
Cleaning of aluminum after machining with coolants, 20:24255 (R;US)
Effect of vacuum chamber eddy current and compensation by digital feedback, 20:24269 (R;US)
Heavy-Section Steel Irradiation Program on irradiation effects in light-water reactor pressure vessel materials, 20:23847 (R;US)
High-intensity single bunch instability behavior in the new SLC damping ring vacuum chamber, 20:24281 (R;US)
Prevention of non-ductile fracture in 6061-T6 aluminum nuclear pressure vessels, 20:23593 (R;US)
Service of reduction bombs, Plutonium Purification and Fabrication, 234-5 Building, 20:23139 (R;US)
Stress-intensity-factor influence coefficients for semielliptical inner-surface flaws in clad pressure vessels, 20:23574 (R;US)

PRESSURIZED WATER COOLED MODERATED REACTOR
See PWR TYPE REACTORS

PRESSURIZED WATER REACTORS
See PWR TYPE REACTORS

PRINTED CIRCUITS
A one piece wall box for space electronics, 20:24043 (R;US)
CFC and CHC reduction at suppliers. Final report, 20:24430 (R;US)
Effects of pre-stressing and flux on the flow of solder on PWB copper surfaces, 20:24041 (R;US)

PROBES
See also MAGNETIC PROBES
Fiber optic probe having fibers with endfaces formed for improved coupling efficiency, 20:24386 (PA;US)
Large-area fiber-optic chemical sensors, 20:24389 (R;US)

PROCESS CONTROL
Modeling, monitoring and control based on neural networks, 20:24013 (R;US)

PROCESS DEVELOPMENT UNITS
Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 10, January 1944–March 1994, 20:23958 (R;US)
Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 11, April–June 1994, 20:23959 (R;US)
Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 12, July–September 1994, 20:23960 (R;US)

PROCESSING (DATA)
See DATA PROCESSING

PROCESSING (WASTES)
See WASTE PROCESSING

PRODUCTION (PAIR)
See PAIR PRODUCTION

PRODUCTION REACTORS
Assessment of Noble Gases in the Savannah River Site Environment, 20:23590 (R;US)
Observations of the boiling process from a downward-facing torispherical surface: Confirmatory testing of the heavy water new production reactor flooded cavity design, 20:23607 (R;US)

PROGRAM MANAGEMENT
Communicating in a multi-project environment with a single-sheet project plan, 20:24944 (R;US)
Risk management in design engineering bids, 20:23986 (R;US)

PROGRAMMING
See also PARALLEL PROCESSING
Soft computing and fuzzy logic, 20:24964 (RA;US)

PROGRAMMING LANGUAGES
Proceedings of the REXX symposium for developers and users, 20:25009 (R;US)

PROJECT MANAGEMENT
See PROGRAM MANAGEMENT

PROPANE
Hardware assembly and prototype testing for the development of a dedicated liquefied propane gas ultra low emission vehicle, 20:23822 (R;US)

PROPANONE
See ACETONE

PROPELLANTS
Cryocycling of energetic materials: Status report for FY94, 20:24418 (R;US)
Molten salt destruction of energetic material wastes as an alternative to open burning. Revision 1, 20:24422 (R;US)
Particle size reduction of propellants by cryocycling, 20:24417 (R;US)

PROPPING AGENTS
Fracturing Fluid Characterization Facility (FFCF): Recent advances, 20:23118 (R;US)

PROPULSION SYSTEMS
Recent test results of a warm gas pumped monopropellant propulsion system, 20:24006 (R;US)

PROSTHESES
A computational method for comparing the behavior and possible failure of prosthetic implants, 20:24704 (R;US)

PROTECTION (RADIATION)
See RADIATION PROTECTION

PROTECTIVE COATINGS
Development of high damage threshold optics for petawatt-class short-pulse lasers, 20:24011 (R;US)
Magnetic thin films formed in a glow discharge. Final report, 20:23778 (R;US)
Robotic weld overlay coatings for erosion control. Quarterly technical progress report, January 1995–March 1995, 20:23852 (R;US)

PROTEIN SEQUENCING
See AMINO ACID SEQUENCE

PROTEIN STRUCTURE
Magnetic resonance studies of isotopically labeled paramagnetic proteins: (2FE-2S) ferredoxins, 20:24661 (RA;US)
Ner protein of phage Mu: Assignments using $^{13}C/^{15}N$-labeled protein, 20:24694 (RA;US)
New strategy for stable-isotope-aided, multidimensional NMR spectroscopy of DNA oligomers, 20:24685 (RA;US)
Peptides and proteins, 20:24667 (RA;US)
REDOR NMR of stable-isotope-labeled protein binding sites, 20:24662 (RA;US)
Selective ^{2}H and ^{13}C labeling in NMR analysis of solution protein structure and dynamics, 20:24660 (RA;US)
Stereospecific assignments of glycine in proteins by stereospecific deuteration and ^{15}N labeling, 20:24672 (RA;US)
Structural studies on leukaemia inhibitory factor, 20:24674 (RA;US)
Structures of larger proteins in solution: Three- and four-dimensional heteronuclear NMR spectroscopy, 20:24659 (RA;US)

PROTEINS
See also CALMODULIN
ENZYMES
GLYCOPROTEINS
MEMBRANE PROTEINS
PEPTIDES
Biosynthetic incorporation of telluromethionine into dihydrofolate reductase and crystallographic analysis of the distribution of tellurium atoms in the protein molecule, 20:24671 (RA;US)
Isotope labeling for NMR studies of macromolecular structure and interactions, 20:24654 (RA;US)
Magnetic resonance studies of isotopically labeled paramagnetic proteins: (2FE-2S) ferredoxins, 20:24661 (RA;US)
Ner protein of phage Mu: Assignments using $^{13}C/^{15}N$-labeled protein, 20:24694 (RA;US)
Sequence-specific ^{1}H, ^{13}C, and ^{15}N resonance assignments for intestinal fatty-acid-binding protein complexed with palmitate (15.4 kDA), 20:24670 (RA;US)
Stereoselective synthesis of stable-isotope-labeled amino acids, 20:24665 (RA;US)
Structures of larger proteins in solution: Three- and four-dimensional heteronuclear NMR spectroscopy, 20:24659 (RA;US)
Time-resolved infrared studies of protein conformational dynamics, 20:24666 (RA;US)
Uniform ^{15}N- and $^{15}N/^{13}C$-labeling of proteins in mammalian cells and solution structure of the amino terminal fragment of u-PA, 20:24673 (RA;US)
Workshop on algorithms for macromolecular modeling. Final project report, June 1, 1994–May 31, 1995, 20:24649 (R;US)

PROTON BEAMS
Calculation of beam neutralization in the IPNS-Upgrade RCS, 20:24138 (R;US)
Calculation of beam radial quality in the U-120K cyclotron, 20:24113 (IA;RU;In Russian)
Electron-proton instability in the IPNS-Upgrade RCS: Part I, 20:24139 (R;US)
Injecting a Kapchinskij-Vladimirskij distribution into a proton synchrotron, 20:24166 (R;US)
Low power RF beam control electronics for the LEB, 20:24288 (R;US)
Study of corrections to the geometrical factor in the space charge impedance for the IPNS upgrade, 20:24141 (R;US)
Study of synchro-betatron coupling in IPNS upgrade RCS, 20:24140 (R;US)

PROTON SOURCES
Generation of high purity cw proton beams from microwave driven sources, 20:24175 (R;US)

PROTON-ANTIPROTON INTERACTIONS
Jet correlation studies as a function of rapidity interval at D0, 20:24794 (R;US)

PROTON-PROTON INTERACTIONS
A search for centrally produced non-q q-bar mesons in proton proton interactions at 450 GeV/c by using the CERN Ω spectrometer, 20:24795 (RA;RU)

PROTONS
Application of heteronuclear couplings to conformational analysis of oligonucleotides, 20:24692 (RA;US)
Proton and deuteron structure functions in muon scattering at 470 GeV, 20:24788 (R;US)

PSI RESONANCES

RADIOACTIVE WASTE PROCESSING
RADIOACTIVE WASTE STORAGE
A PC-based software package for modeling DOE mixed-waste management options, 20:23232 (R;US)
Addressing new policy directions for public scoping: The Multi-Purpose Canister environmental impact statement, 20:23688 (R;US)
Enterprise wide transparent information access, 20:23235 (R;US)
Office of Civilian Radioactive Waste Management Fiscal Year 1994 annual report to Congress, 20:23187 (R;US)
Savannah River Site Waste Management Environmental Impact Statement. Volume 1, Final, 20:23695 (R;US)
Statements of work for FY 1996 to 2001 for the Hanford Low-Level Tank Waste Performance Assessment Project, 20:23300 (R;US)
Universal requisition for waste data collection, 20:23249 (R;US)

RADIOACTIVE WASTE PROCESSING
Dehydration in the hot-gas filtering unit as a means of reducing the volume of secondary waste from the waste burning process, 20:23204 (IA;DE;In German)
Emissions induced by the process of radioactive remnants conditioning, 20:23198 (IA;DE;In German)
Inorganic ion exchange evaluation and design: Silicotitanate ion exchange waste conversion, 20:23226 (R;US)
Looking back on 30 years of experience in the decontamination of radioactive, liquid effluents at KfK. The vapour compression evaporator, for example, 20:23200 (IA;DE;In German)
Management of radioactive remnants at HDB facility of KfK - a survey, 20:23195 (IA;DE;In German)
Melting of radioactive metals from nuclear installations. History and stages of development, 20:23197 (IA;DE;In German)
Mid-year report: IPC liaison and chemistry of thermal reconstitution, 20:23314 (R;US)
Optimization of waste loading in high-level glass in the presence of uncertainty, 20:23231 (R;US)
Solid waste handling, 20:23308 (R;US)
Solidification of evaporator concentrates by means of cementation, 20:23202 (IA;DE;In German)
Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB), 20:23194 (I;DE;In German)
Ten years of experience with the operation of the LAW scrap processing plant, 20:23205 (IA;DE;In German)
Test Plan: Phase 1 demonstration of 3-phase electric arc melting furnace technology for vitrifying high-sodium content low-level radioactive liquid wastes, 20:23312 (R;US)
The current technical level and planned development of waste burning plants installed at HDB, 20:23203 (IA;DE;In German)
The new MAW scrap processing facility, 20:23206 (IA;DE;In German)
Treatment of radioactive remnants. Solidification of evaporation concentrates by vacuum distillation, 20:23201 (IA;DE;In German)
Using systems analysis to improve decision making in solving mixed waste problems at the Oak Ridge National Laboratory, 20:23176 (R;US)

RADIOACTIVE WASTE STORAGE
45-Day safety screen results for Tank 241-U-201, push mode, cores 70, 73 and 74, 20:23274 (R;US)
Analysis of organic carbon and moisture in Hanford single-shell tank waste, 20:23225 (R;US)
Moisture monitoring and control system engineering study, 20:23297 (R;US)
Synthesis report of geo technic assessment to clay-AGP design: reference concept, 20:23191 (R;ES;In Spanish)
Tank 241-BY-104 vapor sampling and analysis tank characterization report, 20:23281 (R;US)
Tank 241-BY-105 vapor sampling and analysis tank characterization report, 20:23282 (R;US)
Tank 241-BY-106 vapor sampling and analysis tank characterization report, 20:23283 (R;US)
Tank 241-BY-108 vapor sampling and analysis tank characterization report, 20:23284 (R;US)
Tank 241-BY-110 vapor sampling and analysis tank characterization report, 20:23289 (R;US)
Tank 241-C-111 vapor sampling and analysis tank characterization report, 20:23285 (R;US)
Tank 241-C-112 vapor sampling and analysis tank characterization report, 20:23286 (R;US)
Thermo-hydro-mechanical characterization of the Spanish reference clay material for engineered barrier for granite and clay MLW repository: laboratory and small mock up testing, 20:23190 (R;ES)
Waste management tasks of the Radwaste Collecting Centers of the Laender, 20:23199 (IA;DE;In German)

RADIOACTIVE WASTES

CALCINED WASTES
HIGH-LEVEL RADIOACTIVE WASTES
LOW-LEVEL RADIOACTIVE WASTES
RADIOACTIVE EFFLUENTS

Alpha Dosimetry
45-Day safety screen results for Tank 241-C-101, auger sample 95-AUG-019, 20:23275 (R;US)
45-Day safety screen results for Tank 241-U-201, push mode, cores 70, 73 and 74, 20:23274 (R;US)

Calcination
Calcination/dissolution residue treatment, 20:23255 (R;US)

Chemical Analysis
45-Day safety screen results for Tank 241-C-101, auger sample 95-AUG-019, 20:23275 (R;US)
45-Day safety screen results for Tank 241-U-201, push mode, cores 70, 73 and 74, 20:23274 (R;US)
Hot sample archiving. Revision 3, 20:23267 (R;US)
Review of sensors for the in situ chemical characterization of the Hanford underground storage tanks, 20:23246 (R;US)

Chemical Composition
Analysis of organic carbon and moisture in Hanford single-shell tank waste, 20:23225 (R;US)

Containment
105-KE Basin isolation barrier leak rate test analytical development. Revision 1, 20:23264 (R;US)

Dissolution
Calcination/dissolution residue treatment, 20:23255 (R;US)

Gas Analysis
Tank 241-BY-104 vapor sampling and analysis tank characterization report, 20:23281 (R;US)
Tank 241-BY-105 vapor sampling and analysis tank characterization report, 20:23282 (R;US)
Tank 241-BY-106 vapor sampling and analysis tank characterization report, 20:23283 (R;US)
Tank 241-BY-108 vapor sampling and analysis tank characterization report, 20:23284 (R;US)
Tank 241-BY-110 vapor sampling and analysis tank characterization report, 20:23289 (R;US)
Tank 241-C-101 vapor sampling and analysis tank characterization report, 20:23294 (R;US)
Tank 241-C-111 vapor sampling and analysis tank characterization report, 20:23285 (R;US)
Tank 241-C-112 vapor sampling and analysis tank characterization report, 20:23286 (R;US)

Ground Disposal
Interim-status groundwater monitoring plan for the 216-B-63 trench. Revision 1, 20:23261 (R;US)
Readiness review plan for the in situ vitrification demonstration of Seepage Pit 1 in Waste Area Grouping 7, 20:23216 (R;US)

Inventories
Double shell tanks plutonium inventory assessment, 20:23305 (R;US)

Materials Handling
Solid waste handling, 20:23308 (R;US)

Meetings
Radioactive and mixed waste - risk as a basis for waste classification. Symposium proceedings No. 2, 20:23215 (R;US)

Moisture
Analysis of organic carbon and moisture in Hanford single-shell tank waste, 20:23225 (R;US)
Moisture monitoring and control system engineering study, 20:23297 (R;US)

Monitoring
IAEA workshop and field trial at the Oak Ridge K-25 Site, 20:24590 (R;US)

Oxidation
The mixed waste management facility. Project baseline revision 1.2, 20:23248 (R;US)

Packaging
Modeling the dynamic crush of impact mitigating materials, 20:24012 (R;US)

Physical Properties
Identification of physical properties for the retrieval data quality objective process, 20:23365 (R;US)

Radiation Hazards
Facility accident considerations in the US Department of Energy Waste Management Program, 20:23167 (R;US)

Radiation Monitoring
Groundwater monitoring plan for the 300 Area process trenches, 20:23334 (R;US)
Weldon Spring Site Environmental Report for calendar year 1994, 20:23352 (R;US)

Radioactive Waste Disposal
Analysis of near-field thermal and psychometric waste package environment using ventilation, 20:23250 (R;US)

Radioactive Waste Management
Facility accident considerations in the US Department of Energy Waste Management Program, 20:23167 (R;US)

Radioactive Waste Processing
Expedited demonstration of molten salt mixed waste treatment technology. Addendum 1, 20:23247 (R;US)
The Mixed Waste Management Facility. Monthly report, September 1994, 20:23243 (R;US)

Removal
Electromagnetic mixed-waste processing system for asbestos decontamination, 20:23184 (R;US)

Sampling
Half-liter supernatant sampler system engineering work plan, 20:23313 (R;US)

Structural Chemical Analysis
Microscopic characterization of crystalline phases in waste forms, 20:23164 (R;US)

Thermochemical Processes
Mid-year report: IPC liaison and chemistry of thermal reconstitution, 20:23314 (R;US)

Toxicity
Facility accident considerations in the US Department of Energy Waste Management Program, 20:23167 (R;US)

Transport
Stress analysis of single port (ISB) jumper connectors for 2-, 3-, and 4-in. sizes, 20:23157 (R;US)

Underground Disposal
A simple procedure for estimating the effective hydraulic conductivity of a two-dimensional saturated or partly-saturated fracture network, 20:23212 (R;US)
Analysis of near-field thermal and psychometric waste package environment using ventilation, 20:23250 (R;US)

Underground Storage
45-day safety screen results and final report for tank 241-C-202, auger samples 95-Aug-026 and 95-Aug-027, 20:23278 (R;US)
45-day safety screen results for tank 241-C-204, auger samples 95-Aug-022 and 95-Aug-023, 20:23277 (R;US)
60-day safety screen results and final report for tank 241-C-111, auger samples 95-Aug-002, 95-Aug-003, 95-Aug-016, and 95-Aug-017, 20:23276 (R;US)
Development and determination of a single-shell tank interim stabilization pumping strategy, 20:23298 (R;US)
Double shell tanks plutonium inventory assessment, 20:23305 (R;US)
Dropping of mixing pump in Tank 102-AP, 20:23292 (R;US)
Facility effluent monitoring plan for the tank farms facilities, 20:23254 (R;US)
Historical tank content estimate for the southeast quadrant of the Hanford 200 Areas, 20:23279 (R;US)
Hot sample archiving. Revision 3, 20:23267 (R;US)
In situ vapor sampling system test procedure, 20:23271 (R;US)
Review of sensors for the in situ chemical characterization of the Hanford underground storage tanks, 20:23246 (R;US)
Structural evaluation of mixer pump installed in Tank 241-AN-107 for caustic addition project, 20:23272 (R;US)
Tank 241-B-106 push mode core sampling and analysis plan, 20:23311 (R;US)
Tank 241-BY-103 vapor sampling and analysis tank characterization report, 20:23288 (R;US)
Tank 241-C-106 process test report, 20:23287 (R;US)
Tank 241-U-106 vapor sampling and analysis tank characterization report, 20:23293 (R;US)
Tank characterization report for Double-Shell Tank 241-SY-102, 20:23280 (R;US)
Waste tank headspace gas and vapor characterization reference guide, 20:23290 (R;US)

Vitrification
Readiness review plan for the in situ vitrification demonstration of Seepage Pit 1 in Waste Area Grouping 7, 20:23216 (R;US)

RADIOCHEMICAL ANALYSIS
Assays and screening of alpha contaminated soils using low-resolution alpha spectroscopy of thick soil samples, 20:24564 (R;US)
Hanford high level waste: Sample Exchange/Evaluation (SEE) Program, 20:23230 (R;US)

SOLAR ENERGY
WIND POWER
State energy data report 1993: Consumption estimates, 20:23740 (R;US)
Use of renewable energy sources in Bavaria - state of the art and potential assessment. A climate protection study, 20:23699 (R;DE;In German)
REPORTING REQUIREMENTS
Certain glycol ethers eliminated from toxic chemical release reporting requirements, 20:23694 (R;US)
REPUBLIC OF KOREA
Hazardous waste management in the Pacific basin, 20:23772 (R;US)
RESEARCH PROGRAMS
See also COORDINATED RESEARCH PROGRAMS
Photovoltaic power supplies for environmental monitoring stations. Final report, 20:23485 (R;DE;In German)
Research and development project plans for FY 1994. 1. Research and development of new energy, 20:23713 (R;JP)
RESEARCH REACTORS
See also FFTF REACTOR
HFBR REACTOR
HFIR REACTOR
IBR-30 REACTOR
JMTR REACTOR
JRR-4 REACTOR
PHEBUS REACTOR
UVAR REACTOR
Design and testing of integrated circuits for reactor protection channels, 20:23614 (R;US)
Detailed flux calculations for the conceptual design of the Advanced Neutron Source Reactor, 20:23605 (R;US)
Detailed heat load calculations at the beginning, middle, and end of cycle for the conceptual design of the Advanced Neutron Source Reactor, 20:23606 (R;US)
Prevention of non-ductile fracture in 6061-T6 aluminum nuclear pressure vessels, 20:23593 (R;US)
RESERVOIR ENGINEERING
Visual display of reservoir parameters affecting enhanced oil recovery. FY 1994 annual report, 20:23076 (R;US)
RESERVOIR ROCK
Advanced secondary recovery demonstration for the Sooner Unit. Annual report, October 1992–May 1993, 20:23059 (R;US)
An experimental and theoretical study to relate uncommon rock/fluid properties to oil recovery. Final report, 20:23070 (R;US)
Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], January 1–March 31, 1993, 20:23052 (R;US)
Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], July 1–September 30, 1992, 20:23051 (R;US)
Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], April 1–June 30, 1993, 20:23053 (R;US)
Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], January 1–March 31, 1993, 20:23052 (R;US)
Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], July 1–September 30, 1992, 20:23051 (R;US)
Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], April 1–June 30, 1993, 20:23053 (R;US)
Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], April 1–June 30, 1992, 20:23050 (R;US)

Electrical and electromagnetic methods for reservoir description and process monitoring. Annual report, October 1, 1992–September 30, 1993, 20:23064 (R;US)
Interdisciplinary study of reservoir compartments. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:23054 (R;US)
Multifrequency crosshole EM imaging for reservoir characterization. FY 1994 annual report, 20:23063 (R;US)
Secondary natural gas recovery – infield reserve growth joint venture: Applications in midcontinent sandstones, 20:23113 (R;US)
Supri heavy oil research program. Annual report, February 8, 1994–February 7, 1995, 20:23082 (R;US)
Visual display of reservoir parameters affecting enhanced oil recovery. Quarterly report, April 1995–June 1995. 2nd Quarter, FY 1995, 20:23055 (R;US)

RESERVOIRS (WATER)

SOIL-STRUCTURE INTERACTIONS
Application of neural networks to seismic active control, 20:24741 (R;US)
Effect of groundwater on soil-structure interaction, 20:23586 (R;US)
SOILS
Absorption Spectroscopy
A quantitative method to detect explosives and selected semivolatiles in soil samples by Fourier transform infrared spectroscopy, 20:24557 (R;US)
Ammonia
The continuous ammonia measurement in the ppb range in aired soil, 20:24586 (R;DE)
Contamination
LRAD surface monitoring results at TA-21, 20:23330 (R;US)
Plutonium mobility studies in soil sediment decontaminated by means of a soil-washing technology, 20:23338 (R;US)
Corrosive Effects
Measurements of the corrosion of low-carbon steel drums under environmental conditions at Hanford: One-year test results, 20:24014 (R;US)
Decontamination
Providing solutions to energy and environmental problems. Quarterly technical progress report, January–March 1995, 20:23091 (R;US)
Providing solutions to energy and environmental problems. Quarterly technical progress report, October–December 1994, 20:23090 (R;US)
Environmental Transport
Fate and transport processes controlling the migration of hazardous and radioactive materials from the Area 5 Radioactive Waste Management Site (RWMS), 20:24578 (R;US)
Excavation
Environmental assessment for Mound Plant decontamination and decommissioning projects, Mound Plant, Miamisburg, Ohio, 20:23344 (R;US)
Hydraulic Conductivity
Modeling of capillary barriers and comparison to data, 20:24611 (R;US)
Mechanical Properties
Geotechnical characterization of the North Ramp of the Exploratory Studies Facility: Yucca Mountain Site Characterization Project. Volume 1, Data summary, 20:23238 (R;US)
Monitoring
Surveillance of Site A and Plot M report for 1994, 20:23159 (R;US)
Pollution
A Bayesian/geostatistical approach to the design of adaptive sampling programs, 20:24559 (R;US)
Radiation Monitoring
Results of the supplementary radiological survey at the former C. H. Schnoor and Company site, 644 Garfield Street, Springdale, Pennsylvania (CVP001), 20:23363 (R;US)
Radiochemical Analysis
Application to transfer radioactive waste to the Nevada Test Site, 20:23946 (R;US)
Radionuclide Migration
Radionuclide concentrations in vegetation at radioactive-waste disposal Area G during the 1994 growing season, 20:23208 (R;US)
Remedial Action
An accelerated remedial strategy developed for J-Field, Aberdeen Proving Ground, Maryland, 20:24558 (R;US)
Developing innovative environmental technologies for DOE needs, 20:23166 (R;US)
Effect of temperature on perchloroethylene dechlorination by a methanogenic consortium, 20:24607 (R;US)
Environmental restoration at the Pantex Plant. Quarterly progress report, April 12, 1995–June 30, 1995, 20:24569 (R;US)
Hanford stakeholder participation in evaluating innovative technologies: VOC product line, Passive soil vapor extraction using borehole flux tunable hybrid plasma, 20:23227 (R;US)
In situ techniques for the characterization and monitoring of a radioactively contaminated site for in situ vitrification, 20:23177 (R;US)
Mixed waste characterization, treatment, and disposal focus area. Technology summary, 20:23347 (R;US)
Preliminary investigation of the 317 Area, ANL-E, 20:23169 (R;US)
Radiological survey results at 914 Black Oak Ridge Road, Wayne, New Jersey (WJ005), 20:24601 (R;US)
Radiological verification survey results as 13 Peck Ave., Pequannock, New Jersey (PJ004V), 20:24598 (R;US)
Radiological verification survey results at 14 Peck Ave., Pequannock, New Jersey (PJ001V), 20:23364 (R;US)
Radiological verification survey results at 15 Peck Ave., Pequannock, New Jersey (PJ005V), 20:24603 (R;US)
Radiological verification survey results at 17 Peck Ave., Pequannock, New Jersey (PJ006V), 20:24599 (R;US)
Radiological verification survey results at 3 Peck Ave., Pequannock, New Jersey (PJ002V), 20:24596 (R;US)

Radiological verification survey results at 7 Peck Ave., Pequannock, New Jersey (PJ003V), 20:24597 (R;US)
Radiological verification survey results at 898 Black Oak Ridge Rd., Wayne, New Jersey (WJ004V), 20:24600 (R;US)
Radiological verification survey results at the Pompton Plains Railroad Spur, Pequannock, New Jersey (PJ008V), 20:24602 (R;US)

Ventilation Barriers
Passive soil venting at the Chemical Waste Landfill Site at Sandia National Laboratories, Albuquerque, New Mexico, 20:23240 (R;US)

Washing
Plutonium mobility studies in soil sediment decontaminated by means of a soil-washing technology, 20:23338 (R;US)

SOLAR ALPHA PARTICLES
^{3}He-enrichments by magnetosonic waves in current-driven instabilities, 20:24878 (R;JP)

SOLAR BATTERIES
See SOLAR CELL ARRAYS

SOLAR CELL ARRAYS
A solar module fabrication process for HALE solar electric UAVs, 20:23479 (R;US)
Research on high-efficiency, large-area $CuInSe_2$-based thin-film modules. Final subcontract report, 16 August 1993–30 June 1995, 20:23476 (R;US)

SOLAR CELLS

INDIUM SELENIDE SOLAR CELLS
SILICON SOLAR CELLS
NREL Photovoltaic Program. FY 1994 annual report, October 1, 1993–September 30, 1994, 20:23473 (R;US)
Numerical modeling of the temperature illumination intensity dependent performance of CIS solar cells, 20:23466 (R;US)
Numericl modeling of graded band gap CIGS solar cells, 20:23467 (R;US)

SOLAR CENTRAL RECEIVERS
See CENTRAL RECEIVERS

SOLAR COLLECTORS
Climate-compatible energy supply in Baden-Wuerttemberg. Solar heat supply including industrial-scale heat storage facilities in Baden-Wuerttemberg, 20:23492 (I;DE;In German)

SOLAR DOMESTIC WATER HEATING
See SOLAR WATER HEATING

SOLAR DRYING
Utilization of solar energy in the industry of ceramics for the drying process, 20:23490 (I;BR;In Portugese)

SOLAR ENERGY
Research and development project plans for FY 1994. 1. Research and development of new energy, 20:23713 (R;JP)

SOLAR ENERGY CONVERSION
User's manual for TMY2s: Derived from the 1961–1990 National Solar Radiation Data Base, 20:23472 (R;US)

SOLAR FLUX
The impacts of data error and model resolution on the result of variational data assimilation, 20:24522 (RA;US)

SOLAR HEAT ENGINES
Design, fabrication, and testing of a sodium evaporator for the STM4-120 kinematic Stirling engine, 20:23488 (R;US)

SOLAR HEATING SYSTEMS
Climate-compatible energy supply in Baden-Wuerttemberg. Solar heat supply including industrial-scale heat storage facilities in Baden-Wuerttemberg, 20:23492 (I;DE;In German)

SOLAR NEUTRINOS
The Russian-American gallium solar neutrino experiment, 20:24762 (R;US)

SOLAR POWER PLANTS
See also PHOTOVOLTAIC POWER PLANTS
A nightly conditioning method to reduce parasitic power consumption in molten-salt central-receiver solar-power plants, 20:23489 (R;US)

SOLAR RADIATION
Characterization of vegetation properties: Canopy modeling of pinyon-juniper and ponderosa pine woodlands; Final report. Modeling topographic influences on solar radiation: A manual for the SOLARFLUX model, 20:24593 (R;US)
Mean fluxes of the near-infrared radiation in broken clouds, 20:24526 (RA;US)
Solar radiance transmission interferometer observations at the Southern Great Plains Cloud and Radiation Testbed site, 20:24497 (RA;US)
User's manual for TMY2s: Derived from the 1961–1990 National Solar Radiation Data Base, 20:23472 (R;US)

SOLAR WATER HEATING
Testing of simple solar preheaters with different auxiliary heating systems. Final report, 20:23491 (R;DE;In German)

SOLFRAC PROCESS
See ENHANCED RECOVERY

SOLID CLUSTERS
Spectroscopy at metal cluster surfaces. Annual report, Year 2, 20:24837 (R;US)

SOLID ELECTROLYTE FUEL CELLS
Direct-hydrogen-fueled proton-exchange-membrane (PEM) fuel cell system for transportation applications. Quarterly technical progress report Number 1, July 1–September 30, 1994, 20:23813 (R;US)

SOLID ELECTROLYTES
Trend in research of lithium conductive solid electrolyte, 20:23666 (R;JP;In Japanese)

SOLID LUBRICANTS
Electrophoretically-deposited solid film lubricants, 20:23922 (R;US)

SOLID STATE LASERS
See also NEODYMIUM LASERS
SEMICONDUCTOR LASERS
Amplification of femtosecond pulses to above 1 J with large aperture Cr:LiSrAlF$_6$ amplifiers, 20:24054 (R;US)
Diode-pumped solid state laser for inertial fusion energy, 20:24914 (R;US)
New diode wavelengths for pumping solid-state lasers, 20:24052 (R;US)

SOLID WASTES
See also TAILINGS
Laboratory studies of a hydrothermal pretreatment process for municipal solid waste, 20:23808 (R;US)

SOLIDIFICATION
Treatment of radioactive remnants. Solidification of evaporation concentrates by vacuum distillation, 20:23201 (IA;DE;In German)

SOLIDS
Simple surface structure determination from Fourier transforms of angle-resolved photoemission extended fine structure, 20:24848 (RA;US)

SOLITONS
The rotationally improved Skyrmion, or RISKY, 20:24785 (R;US)

SOLUTES
Diffusion in polycrystalline microstructures, 20:23927 (R;US)

SOLVENTS
See also ORGANIC SOLVENTS
CFC and CHC reduction at suppliers. Final report, 20:24430 (R;US)

SONDES
See PROBES

SOURCE TERMS
Sensitivities to source-term parameters of emergency planning zone boundaries for waste management facilities, 20:24444 (R;US)

SOUTH ATLANTIC BIGHT
Shelf export of particulates/transport in continental margin waters. Final report, 20:24628 (R;US)

Proceedings of the 13. workshop on charged particle accelerators. Volume 1, 20:24066 (I;RU;In Russian)
Apertures
Dynamic aperture measurement at the H-100 Kharkov storage ring, 20:24323 (IA;RU;In Russian)
Beam Dynamics
A theoretical study of the electron-proton instability in a long proton pulse, 20:24131 (R;US)
Electron clearing in the Los Alamos Proton Storage Ring, 20:24130 (R;US)
Recent progress on beam stability study in the PSR, 20:24132 (R;US)
Beam Injection
Storage-cooling ring for injection complex of F- and B-factories, 20:24320 (IA;RU;In Russian)
Beam Optics
Difference resonance study on the electron storage ring Aladdin at SRC, 20:24134 (R;US)
Experimental determination of linear optics including quadrupole rotations, 20:24302 (R;US)
Beam Production
Longitudinally polarized electron beam at the internal target of the pulse stretcher ring HP - 2000, 20:24322 (IA;RU;In Russian)
Betatron Oscillations
Difference resonance study on the electron storage ring Aladdin at SRC, 20:24134 (R;US)
Fourth-integral resonance study on Alladin at SRC, 20:24333 (R;US)
Electron Beams
Ion drift in electron beams, 20:24327 (IA;RU;In Russian)
Energy Losses
Loss parameter calculations, 20:24331 (R;US)
Heavy Ions
Heavy ion accelerating-storage complex (IYal, Kiev), 20:24310 (IA;RU;In Russian)
Ion Density
Ion drift in electron beams, 20:24327 (IA;RU;In Russian)
Kharkov Linac
HP - 2000. Present status, 20:24321 (IA;RU;In Russian)
Magnets
Thermal and mechanical measurements of the prototype SR quadrupole, 20:24332 (R;US)
Mechanical Vibrations
Study on seismic noise effect on electron beam parameters of the 'Zelenograd' specialized synchrotron radiation source, 20:24317 (IA;RU;In Russian)
Orbit Stability
Orbit stability improvement at the NSLS x-ray ring, 20:24301 (R;US)
Polarized Beams
Longitudinally polarized electron beam at the internal target of the pulse stretcher ring HP - 2000, 20:24322 (IA;RU;In Russian)
Start-Up
Commissioning of the Argonne positron accumulator ring, 20:24164 (R;US)
Superconducting Magnets
A design method for multiple tube gas-cooled electrical leads for the g-2 superconducting magnets, 20:24328 (R;US)
Synchrotron Radiation
Study on seismic noise effect on electron beam parameters of the 'Zelenograd' specialized synchrotron radiation source, 20:24317 (IA;RU;In Russian)

SUCCINIC ACID
The effect of biotin on the production of succinic acid by Anaerobiospirillum succiniciproducens, 20:24643 (R;US)
SULFATES
Low severity upgrading of F-T waxes with solid superacids. Quarterly report, January 1995–March 1995, 20:22991 (R;US)
Vitrification development for mixed wastes, 20:23233 (R;US)
SULFITE WASTE LIQUOR
See SPENT LIQUORS

SULFUR
Microbially-enhanced redox solution reoxidation for sweetening sour natural gas, 20:23119 (R;US)
Production of elemental sulfur and methane from H_2S and CO_2 derived from a coal desulfurization process. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:23001 (R;US)
Rate enhancement for catalytic upgrading coal naphthas. Final of final technical progress report, July 1991–September 1994, 20:22990 (R;US)

SULFUR DIOXIDE
ABB wet flue gas desulfurization, 20:23006 (RA;US)
Advanced separation technology for flue gas cleanup. Quarterly technical report No. 11, October 1994–December 1994, 20:23019 (R;US)
Babcock & Wilcox technologies for power plant stack emissions control, 20:23008 (RA;US)
Cost effective treatment for wet FGD scrubber bleedoff, 20:23010 (RA;US)
Design considerations for wet flue gas desulfurization systems - wet scrubber hardware issues, 20:23009 (RA;US)
Development of advanced, dry, SO_x/NO_x emission control technologies for high-sulfur coal. Final report, April 1, 1993–December 31, 1994, 20:23525 (R;US)
Development of the integrated environmental control model: Performance model for the NOXSO process. Quarterly progress report, 20:23524 (R;US)
Milliken Station Demonstration Project FDG retrofit update, 20:23011 (RA;US)
Sonic enhanced ash agglomeration and sulfur capture. Technical progress report, January 1995–March 1995, 20:23015 (R;US)
Two years of outstanding AFGD performance, pure air on the Lakes Bailly Scrubber Facility, 20:23007 (RA;US)

SUN
Solar variability observed through changes in solar limb-darkening function and mean diameter. Progress report, 20:24761 (R;US)

SUPERCOMPUTERS
Adventures in Supercomputing: An innovative program, 20:24924 (R;US)

SUPERCONDUCTING CAVITY RESONATORS
Complex of equipment for manufacturing and treatment of Nb/Cu based superconducting resonators, 20:24215 (IA;RU;In Russian)
Investigations of superconducting resonators at the Institute for Nuclear Research RAN, 20:24213 (IA;RU;In Russian)
Methods of technological control during manufacturing of superconducting resonators, 20:24216 (IA;RU;In Russian)
On thermal stability of superconducting resonator, 20:24214 (IA;RU;In Russian)
Present status on superconducting cavity resonators at the Institute for High Energy Physics, 20:24204 (IA;RU;In Russian)
Superconducting acceleration RF-structure with longitudinal detachable joints, 20:24217 (IA;RU;In Russian)

SUPERCONDUCTING COILS
Performance of pancake coils of parallel co-wound Ag/BSCCO tape conductors in static and ramped magnetic fields, 20:24856 (R;US)

SUPERCONDUCTING FILMS
Relationships between processing temperature and microstructure in isothermal melt processed Bi-2212 thick films, 20:23894 (R;US)

SUPERCONDUCTING JUNCTIONS
Epitaxial $SrRuO_3$ films, 20:24857 (PA;US)

SUPERCONDUCTING MAGNETIC ENERGY STORAGE
High-temperature superconductor current leads for electric utility SMES applications, 20:23665 (R;US)
The emerging roles of energy storage in a competitive power market: Summary of a DOE Workshop, 20:23664 (R;US)

SUPERCONDUCTING MAGNETS
A design method for multiple tube gas-cooled electrical leads for the g-2 superconducting magnets, 20:24328 (R;US)
A high gradient superconducting quadrupole for a low charge state ion linac, 20:24174 (R;US)
Calculated and measured fields in superferric wiggler magnets, 20:24239 (RA;US)
Corrector magnets: Combined structural analysis of collider 50 mm aperture ordered wound sextupoles intedrior section, 20:24289 (R;US)
Eddy current and quench loads and stress of SSC collider 4-K liner and the bore tube during magnet quench, 20:24291 (R;US)
Field of a helical Siberian Snake, 20:24243 (RA;US)
Magnet Technical Review Panel. Final report, 20:24297 (R;US)
Magnet measurement workshop, 20:24298 (R;US)
Optimization of algorithms for calculating magnetic fields of iron-free magnetic systems, 20:24224 (IA;RU;In Russian)
Quench antennas for RHIC quadrupole magnets, 20:24180 (R;US)
Skew quadrupole in RHIC dipole magnets at high fields, 20:24179 (R;US)
Superconducting Super Collider Magnet System requirements. Revision A, 20:24285 (R;US)
Superconducting Super Collider reference design magnets Style "D" cost design. Contents, 20:24296 (R;US)
Thermal and flow considerations for the 80 K shield of the SSC magnet cryostats, 20:24287 (R;US)

SUPERCONDUCTING SUPER COLLIDER
Electroweak and flavor physics: Implications for the SSC. Second annual SSCL spring conference, 20:24779 (R;US)

Beam Bunching
New transverse damper correction scheme, 20:24150 (R;US)

Beam Extraction
Accidental beam loss in superconducting accelerators: Simulations, consequences of accidents and protective measures, 20:24294 (R;US)

Beam Injection
Accidental beam loss in superconducting accelerators: Simulations, consequences of accidents and protective measures, 20:24294 (R;US)

Beam-Beam Interactions
Compensation of the beam-beam effect in proton-proton colliders, 20:24151 (R;US)
Principles of interaction region design in Hadron Colliders and their application to the SSC, 20:24152 (R;US)

Bellows
Impedance measurements of rf joint (Bellows shield) for collider, 20:24286 (R;US)

Computer Codes
The SSCL framework software plans, 20:24292 (R;US)

Data Acquisition Systems
Workshop on data acquisition and trigger system simulations for high energy physics, 20:24295 (R;US)

Design
Report of the task force on SSC commissioning and operations, 20:24098 (R;US)
Supercollider program plan. Phase 1, 20:24096 (R;US)

Engineered Safety Systems
A high reliability oxygen deficiency monitoring system, 20:24290 (R;US)

Liners
Eddy current and quench loads and stress of SSC collider 4-K liner and the bore tube during magnet quench, 20:24291 (R;US)

Management
Superconducting Super Collider management plan. Phase 1, 20:24097 (R;US)
Superconducting Super Collider site environmental report for calendar year 1991. Pre-operational, 20:24947 (R;US)

Meetings
Proceedings of the meetings on the SSC between representatives of industry and high energy physics, 20:24099 (R;US)

Operation
Report of the task force on SSC commissioning and operations, 20:24098 (R;US)

Research Programs
Interim report, 20:24100 (R;US)
Seismic Detection
Underground measurements of seismic vibrations at the SSC site, 20:24094 (R;US)
Shielding
Shielding consideration for the SSCL experimental halls, 20:24095 (R;US)
Shower Counters
Report of the Task Force on detector Research and Development for the Superconducting Super Collider, 20:24374 (R;US)
Space Charge
Passing through half-integer resonance due to space charge under different initial distributions, 20:24149 (R;US)
Superconducting Magnets
Corrector magnets: Combined structural analysis of collider 50 mm aperture ordered wound sextupoles intedrior section, 20:24289 (R;US)
Magnet measurement workshop, 20:24298 (R;US)
Superconducting Super Collider reference design magnets Style "D" cost design. Contents, 20:24296 (R;US)
Trigger Circuits
Workshop on data acquisition and trigger system simulations for high energy physics, 20:24295 (R;US)

ITEP: A survey of innovative environmental restoration technologies in the Netherlands and France, 20:23716 (R;US)
TELLURIUM
Biosynthetic incorporation of telluromethionine into dihydrofolate reductase and crystallographic analysis of the distribution of tellurium atoms in the protein molecule, 20:24671 (RA;US)
Radioisotope yields from 1.85-GeV protons on Mo and 1.85- and 5.0-GeV protons on Te, 20:24826 (R;US)
TELLURIUM IONS
Transverse emittance systematics measured for heavy-ion beams at ATLAS, 20:24106 (R;US)
TEMPERATURE DEPENDENCE
Development of technologies to hasten the growth of Japanese flounder. 4. Effects of temperature on the growth of Japanese flounder, 20:24625 (R;JP;In Japanese)
TEMPERATURE EFFECTS
See TEMPERATURE DEPENDENCE
TEMPERATURE MEASUREMENT
An investigation of vertical winds obtained from vertically pointing and tilted beams of a five-beam 915-MHz wind profiler, 20:24445 (R;US)
TERRESTRIAL ECOSYSTEMS
Risk information in support of cost estimates for the Baseline Environmental Management Report (BEMR). Section 1, 20:24605 (R;US)
TERTIARY RECOVERY
See ENHANCED RECOVERY
TEST FACILITIES
Dual Axis Radiographic Hydrodynamic Test Facility: Draft environmental impact statement, 20:24426 (R;US)

Environmental assessment for device assembly facility operations, Nevada Test Site, Nye County, Nevada. Final report, 20:23827 (R;US)
Power systems development facility. Quarterly technical progress report, July 1, 1994–September 30, 1994, 20:23013 (R;US)

TESTING
Project C-018H, 242-A evaporator/PUREX Plant Process Condensate Treatment Facility Instrumentation and Control (I&C), 20:23258 (R;US)

TETRACHLOROMETHANE
See CARBON TETRACHLORIDE

TEVATRON
See FERMILAB TEVATRON

TEWA EVENT

TEXAS
An integrated study of the Grayburg/San Andres Reservoir, Foster and South Cowden Fields, Ector County, Texas. Quarterly technical progress report No. 3, February 1, 1995–April 30, 1995, 20:23062 (R;US)
Post waterflood CO_2 miscible flood in light oil, fluvial-dominated deltaic reservoir. Annual report, October 1, 1993–September 30, 1994, 20:23084 (R;US)
Revitalizing a mature oil play: Strategies for finding and producing unrecovered oil in Frio Fluvial-Deltaic Sandstone Reservoirs of South Texas, 20:23060 (R;US)
Secondary natural gas recovery – infield reserve growth joint venture: Applications in midcontinent sandstones, 20:23113 (R;US)

TEXAS COLLEGE STATION TRAINING REACTOR
See NSCR REACTOR

TEXAS EXPERIMENTAL TOKAMAK
See TEXT DEVICES

TEXT DEVICES
Texas Experimental Tokamak, a plasma research facility: Technical progress report, 20:24862 (R;US)

TEXTILE INDUSTRY
The AMTEX Partnership. Second quarter report, Fiscal Year 1995, 20:23715 (R;US)
The Amtex DAMA Project: The Brookhaven contribution, 20:23711 (R;US)

TFTR DEVICE
See TFTR TOKAMAK

TFTR REACTORS
See TFTR TOKAMAK

TFTR TOKAMAK
Alfven cyclotron instability and ion cyclotron emission, 20:24875 (R;US)
Collisional stochastic ripple diffusion of alpha particles and beam ions on TFTR, 20:24874 (R;US)
Enhanced loss of fusion products during mode conversion heating in TFTR, 20:24876 (R;US)
Experimental study of toroidicity-induced Alfven eigenmode (TAE) stability at high q(0), 20:24877 (R;US)
Radiological safety of DT experiments at TFTR, 20:24899 (R;JP;In Japanese)

THE GEYSERS
See GEYSERS GEOTHERMAL FIELD

THERMAL ANALYSIS
Additional verification problems for HEATING 7.2, 20:25000 (R;US)
An atlas of thermal data for biomass and other fuels, 20:23428 (R;US)

THERMAL BATTERIES
Deformation study of separator pellets for thermal batteries, 20:23668 (R;US)
Thermal batteries: A technology review and future directions, 20:23669 (R;US)

THERMAL EFFECTS
See TEMPERATURE DEPENDENCE

THERMAL ENERGY STORAGE EQUIPMENT
Climate-compatible energy supply in Baden-Wuerttemberg. Solar heat supply including industrial-scale heat storage facilities in Baden-Wuerttemberg, 20:23492 (I;DE;In German)
Development of novel dynamic latent heat storage processes, 20:23755 (R;DE;In German)

THERMAL INSULATION
Radiation and gas conduction heat transport across a helium dewer multilayer insulation system, 20:24760 (RA;US)

THERMAL NEUTRONS
A variety of neutron sensors based on scintillating glass waveguides, 20:24372 (R;US)

THERMAL POLLUTION (AIR)
See AIR POLLUTION

THERMAL POWER PLANTS

FOSSIL-FUEL POWER PLANTS
GEOTHERMAL POWER PLANTS
NUCLEAR POWER PLANTS
Experience in independent power production: Two projects that closed, 20:23529 (RA;US)
Globalizing core business strategies for U.S. utilities, 20:23528 (RA;US)
HANJUNG's overseas marketing for power industry, 20:23527 (RA;US)
Power plant engineering for overseas market, 20:23530 (RA;US)

THERMAL PROPERTIES
See THERMODYNAMIC PROPERTIES

THERMAL RADIATION
Mean fluxes of the near-infrared radiation in broken clouds, 20:24526 (RA;US)

THERMAL SHIELDS
Thermal and flow considerations for the 80 K shield of the SSC magnet cryostats, 20:24287 (R;US)

THERMIONIC REACTOR CRITICAL EXPERIMENTS
See ZERO POWER REACTORS

THERMODYNAMIC CYCLES
Development of two-stage compression heat pump for hot water supply in commercial use. Demonstrated performance of a system applied with vertical shell and tube multifunction intermediate heat exchanger, 20:23776 (R;JP;In Japanese)

THERMODYNAMIC PROPERTIES
Ground- and space-based humidity profiling in a cloudy atmosphere with strong elevated temperature inversion, 20:24511 (RA;US)

THERMOELECTRIC CELLS
See THERMOELECTRIC GENERATORS

THERMOELECTRIC CONVERTERS
See THERMOELECTRIC GENERATORS

THERMOELECTRIC GENERATORS
Heatpipe space power and propulsion systems, 20:23559 (R;US)
Monthly technical progress report, May 29, 1995–July 2, 1995, 20:23558 (R;US)
Test plan/procedure for the shock limiting device of the radioisotope thermoelectric generator package mounting subsystem 145. Revision 1, 20:24015 (R;US)

THERMOELECTRIC MATERIALS
Thermoelectric material development. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:23743 (R;US)

THERMONUCLEAR DEVICES
See also ICF DEVICES
The use of programmable controllers in the control and monitoring system of a large nuclear fusion experiment, 20:24900 (IA;RU)

THERMONUCLEAR POWER PLANTS
Environmental aspects of prospective energy generation by the inertial confinement fusion process. Pt. A. DT fusion, 20:24888 (R;DE;In German)

THERMONUCLEAR REACTOR COOLING SYSTEMS
Heat transfer experiments on the cooling tubes for divertor plates under one-sided heating conditions, 20:24898 (R;JP)

THERMONUCLEAR REACTOR MATERIALS
Energy-filtered plasmon images of $MgAl_2O_4$ implanted with Al^+ and Mg^+ ions, 20:24884 (R;US)

THERMONUCLEAR REACTORS
See also D-T REACTORS
ION BEAM FUSION REACTORS

LASER FUSION REACTORS
TOKAMAK TYPE REACTORS
Safety of magnetic fusion facilities: Volume 2, Guidance, 20:24887 (R;US)

THERMONUCLEAR WEAPONS
See NUCLEAR WEAPONS

THERMOPHILIC CONDITIONS
Hemicellulases from anaerobic thermophiles. Progress report, 20:23418 (R;US)

THERMOSYPHONS
Development of a flexible thermosyphon for cooling a concentrated heat source, 20:23998 (R;US)

THIN FILMS
Development and use of image scanning ellipsometer to study the dynamics of heated thin liquid films. Progress report, July 1, 1989–December 31, 1994, 20:24020 (R;US)
Pulsed ion beam methods for in situ characterization of diamond film deposition processes, 20:24853 (R;US)

THIOPHENES
See POLYCYCLIC SULFUR HETEROCYCLES

THIOPHOSGENE
See ORGANIC CHLORINE COMPOUNDS

THORIUM
Consistent calculations of fast neutron induced fission, (n,2n) and (n,3n) cross-sections for 71 isotopes of Th, Pa, U, Np, Pu, Am, Cm, Bk and Cf, 20:24817 (R;JP)

THORIUM 232
Geologic, geochemical, and geographic controls on NORM in produced water from Texas oil, gas, and geothermal reservoirs. Final report, 20:23093 (R;US)

THYROXINE
Artificial imprinting and smoltification in juvenile kokanee salmon: Implications for operating Lake Roosevelt kokanee salmon hatcheries. Annual report 1994, 20:23461 (R;US)

TIGHT SANDS
See PERMEABILITY
SANDSTONES

TIME-OF-FLIGHT SPECTROMETERS
Analysis of sample composition using resonant ionization and time-of-flight techniques, 20:23940 (R;ES;In Spanish)

TIOGA NITROGEN REMOVAL PROCESS
See NITROGEN

TISSUE-EQUIVALENT MATERIALS
Attenuation coefficients of human tissues and tissue substitutes, 20:24721 (R;JP;In Japanese)

TISSUES
Modeling of ablation by photospallation using the computer program PUFF/DFRACT, 20:24707 (R;US)

TITANATES
See also PZT
In situ MeV ion beam analysis of ceramic surfaces modified by 100-400 keV ion irradiation, 20:23896 (R;US)
Waste forms based on Cs-loaded silicotitanates, 20:23234 (R;US)

TITANIUM
Development of a sensor and control system for the production of titanium matrix composites, 20:23876 (R;US)
Research on fretting corrosion behavior of structural materials used in nitric acid environments for spent fuel reprocessing. 1. Difference in fretting corrosion resistance among austenitic stainless steel, Ti and Zr, 20:23140 (R;JP;In Japanese)
Terminal ballistic experiments for the development of turbine engine blade containment technology, 20:24029 (R;US)

TITANIUM ALLOYS
See also TITANIUM BASE ALLOYS
Mechanistic modeling of high-temperature ordered intermetallics, 20:23846 (R;US)
Room and elevated temperature mechanical properties of PM TiAl alloy Ti-47Al-2Cr-2Nb, 20:23839 (R;US)
Time-dependent stress concentration and microcrack nucleation in TiAl, 20:23840 (R;US)

TITANIUM BASE ALLOYS
Analysis of buckling distortion in bead-on-plate Ti 6-4 welds, 20:23871 (R;US)

TITANIUM CARBIDES
Sintering of ceramics using low frequency rf power, 20:23886 (R;US)

TITANIUM OXIDES
Growth and properties of $PbTiO_3$/PLT heterostructures, 20:23884 (R;US)
Transient studies of low temperature catalysts for methane conversion. Quarterly technical progress report, January 1, 1995–March 31, 1995, 20:22996 (R;US)

TNT
A quantitative method to detect explosives and selected semivolatiles in soil samples by Fourier transform infrared spectroscopy, 20:24557 (R;US)
Advances in the chemical conversion of energetic materials to higher value products, 20:24425 (R;US)

Semiannual report to Congress, October 1, 1994–March 31, 1995, 20:23722 (R;US)
US Department of Energy Office of Inspector General report on audit of the Department of Energy's management of precious metals, 20:24427 (R;US)
Computer Networks
Virtual laboratories: Collaborative environments and facilities-on-line, 20:24978 (R;US)
Coordinated Research Programs
Board on Earth Sciences and Resources and its activities, 20:24744 (R;US)
The AMTEX Partnership. Second quarter report, Fiscal Year 1995, 20:23715 (R;US)
Virtual laboratories: Collaborative environments and facilities-on-line, 20:24978 (R;US)
Data Base Management
Enterprise wide transparent information access, 20:23235 (R;US)
Education
Graduate student theses supported by DOE's Environmental Sciences Division, 20:23712 (R;US)
Emergency Plans
Development and use of consolidated criteria for evaluation of emergency preparedness plans for DOE facilities, 20:23336 (R;US)
Pollution Abatement
Information exchange within the U.S. Department of Energy pollution prevention community, 20:23686 (R;US)
Public Opinion
The plethora of publics and their participation in policy making: How can they properly participate?, 20:23677 (R;US)
Radioactive Waste Management
Developing innovative environmental technologies for DOE needs, 20:23166 (R;US)
Office of Civilian Radioactive Waste Management Fiscal Year 1994 annual report to Congress, 20:23187 (R;US)
Waste processing demonstrations within the Waste Pretreatment and Processing Program of the Tank Focus Area, 20:23174 (R;US)
Remedial Action
Contaminant plumes containment and remediation focus area. Technology summary, 20:24575 (R;US)
The value added of conducting regional versus local stakeholder involvement in evaluating technology acceptance, 20:23704 (R;US)
Research Programs
Graduate student theses supported by DOE's Environmental Sciences Division, 20:23712 (R;US)
Standards
Department of Energy Standards Index, 20:24935 (R;US)
Waste Disposal
Environmental guidance regulatory bulletin, 20:23693 (R;US)
Waste Transportation
Automated Transportation Management System (ATMS) Software Project Management Plan (SPMP). Revision 2, 20:23156 (R;US)
US DOE INSPECTOR GENERAL
Semiannual report to Congress, October 1, 1994–March 31, 1995, 20:23722 (R;US)
US DOE PROGRAM MANAGEMENT
See PROGRAM MANAGEMENT

US NATIONAL ENVIRONMENTAL POLICY ACT
A model for determining the scope and level of detail that is appropriate for a programmatic EIS, 20:23709 (R;US)
Research and institutional dimensions of environmental justice: Implications for NEPA documentation, 20:23689 (R;US)

US NRC
Enforcement actions: Significant actions resolved. Reactor licensees: Volume 14, No. 1, Part 1, Quarterly progress report January–March 1995, 20:23562 (R;US)
Indexes to Nuclear Regulatory Commission issuances, January–March 1995. Volume 41, Index 1, 20:23560 (R;US)
NRC TLD Direct Radiation Monitoring Network: Volume 15, No. 1. Progress report, January–March 1995, 20:24595 (R;US)
NRC's object-oriented simulator instructor station, 20:23542 (R;US)
Non-Power Reactor Operator Licensing Examiner Standards. Revision 1, 20:23563 (R;US)
Nuclear Regulatory Commission issuances, April 1995. Volume 41, Number 4, 20:23537 (R;US)
Nuclear Regulatory Commission issuances, March 1995. Volume 41, No. 3, 20:23561 (R;US)
Revised analyses of decommissioning for the reference boiling water reactor power station. Effects of current regulatory and other considerations on the financial assurance requirements of the decommissioning rule and on estimates of occupational radiation exposure: Main report, draft report for comment. Volume 1, 20:23630 (R;US)
Revised analyses of decommissioning for the reference boiling water reactor power station. Effects of current regulatory and other considerations on the financial assurance requirements of the decommissioning rule and on estimates of occupational radiation exposure: Appendices, draft report for comment. Volume 2, 20:23631 (R;US)

US RESOURCE RECOVERY ACTS
See RESOURCE RECOVERY ACTS

US SUPERFUND
Hazardous waste cleanup: A case study for developing efficient programs, 20:23687 (R;US)
Work plan for conducting an ecological risk assessment at J-Field, Aberdeen Proving Ground, Maryland, 20:24563 (R;US)

WAKEFIELD ACCELERATORS
Charged particle acceleration by a wake field in magnetoactive plasma waveguide, 20:24118 (IA;RU;In Russian)
Witness gun for the Argonne Wakefield Accelerator, 20:24171 (R;US)

WALL LOADING
Heat transfer experiments on the cooling tubes for divertor plates under one-sided heating conditions, 20:24898 (R;JP)

WALLS
Dynamic response of a pair of walls retaining a viscoelastic solid, 20:23976 (R;US)

WAPA
See WESTERN AREA POWER ADMINISTRATION

WASHINGTON
Avian use of proposed KENETECH and CARES wind farm sites in Klickitat County, Washington: Technical report. Appendix D, 20:23503 (R;US)
Columbia Wind Farm #1 EIS: Botanical resources technical report for the Conservation and Renewable Energy System. Appendix B, 20:23502 (R;US)

WASHOUT
Modelling absorption and dilution of unconfined releases of hazardous gases by water curtains or monitors, 20:24451 (R;US)

WASTE DISPOSAL
See also RADIOACTIVE WASTE DISPOSAL
SANITARY LANDFILLS
Environmental assessment and social justice, 20:23219 (R;US)

WASTE FORMS
Expedited demonstration of molten salt mixed waste treatment technology. Addendum 1, 20:23247 (R;US)
Laboratory testing of LITCO glasses, 20:23901 (R;US)
Microscopic characterization of crystalline phases in waste forms, 20:23164 (R;US)
Optimization of waste loading in high-level glass in the presence of uncertainty, 20:23231 (R;US)
Performance testing of West Valley Reference 6 glass, 20:23899 (R;US)
The corrosion behavior of DWPF glasses, 20:23900 (R;US)
Waste forms based on Cs-loaded silicotitanates, 20:23234 (R;US)

WASTE ISOLATION PILOT PLANT
See WIPP

WASTE MANAGEMENT
See also RADIOACTIVE WASTE MANAGEMENT
WASTE DISPOSAL
WASTE PROCESSING
WASTE STORAGE
WASTE TRANSPORTATION
Application of macro material flow modeling to the decision making process for integrated waste management systems, 20:23236 (R;US)
Cost Quality Management Assessment for the Oakland Operations Office. Final report, 20:23182 (R;US)
Mixed waste focus area alternative technologies workshop, 20:23211 (R;US)
P2 performance measurement tools workbook: Draft, 20:23242 (R;US)

WASTE PELLETS
45-day safety screen results and final report for tank 241-C-202, auger samples 95-Aug-026 and 95-Aug-027, 20:23278 (R;US)
45-day safety screen results for tank 241-C-204, auger samples 95-Aug-022 and 95-Aug-023, 20:23277 (R;US)
60-day safety screen results and final report for tank 241-C-111, auger samples 95-Aug-002, 95-Aug-003, 95-Aug-016, and 95-Aug-017, 20:23276 (R;US)
Historical tank content estimate for the southeast quadrant of the Hanford 200 Areas, 20:23279 (R;US)
Tank 241-B-106 push mode core sampling and analysis plan, 20:23311 (R;US)
Tank characterization report for Double-Shell Tank 241-SY-102, 20:23280 (R;US)

WASTE PROCESSING
See also MOLTEN SALT WASTE GASIFICATION PROCESS
RADIOACTIVE WASTE PROCESSING
Evaluation of density separation and other treatment methods for plastic media blasting (PMB) waste, 20:23795 (R;US)

WASTE PROCESSING PLANTS
Case studies in residual use and energy conservation at wastewater treatment plants, 20:23805 (R;US)
Improvement of a three-dimensional atmospheric dynamic model and examination of its performance over complex terrain, 20:24544 (R;JP;In Japanese)
The Mixed Waste Management Facility. Monthly report, September 1994, 20:23243 (R;US)
WHC-SD-W252-FHA-001, Rev. 0: Preliminary fire hazard analysis for Phase II Liquid Effluent Treatment and Disposal Facility, Project W-252, 20:23269 (R;US)

WASTE PRODUCT UTILIZATION
Collection and conversion of silicon furnace waste gas into higher value products: Phase 3, 6 MW pilot plant dc closed furnace technology. Final report, 20:23785 (R;US)

WASTE SOLUTIONS
See LIQUID WASTES

WASTE STORAGE
See also RADIOACTIVE WASTE STORAGE
Using new replication features of Oracle 7 in emergency management system, 20:23705 (R;US)

WASTE TRANSPORTATION
Application to transfer radioactive waste to the Nevada Test Site, 20:23946 (R;US)
Automated Transportation Management System (ATMS) Software Project Management Plan (SPMP). Revision 2, 20:23156 (R;US)

WASTE TREATMENT

WATER HAMMER
Pressure transient in liquid lines, 20:23565 (R;US)

WATER HEATERS
Partnerships for technology introduction – Putting the technologies of tomorrow into the marketplace of today. Report to Congress on Sections 127 and 128 of the Energy Policy Act of 1992, 20:23749 (R;US)

WATER MODERATOR
See WATER

WATER POLLUTION ABATEMENT
Membrane technologies for environmental applications, 20:24629 (R;IT)

WATER QUALITY
The Aegis initiative: An integrated, real-time, environmental monitoring and response management capability. Final report, 20:23708 (R;US)

WATER RESERVOIRS
Effects of Flaming Gorge Dam hydropower operations on flow and stage in the Green River, Utah and Colorado, 20:23446 (R;US)
Reservoir release patterns for hydropower operations at the Aspinall Unit on the Gunnison River, Colorado, 20:23447 (R;US)

WATER RESOURCES
Compilation of data for isotope mapping of groundwater in the Central Valley of California, 1993-1995, 20:24613 (R;US)

WATER TREATMENT
Characterization of oil and gas waste disposal practices and assessment of treatment costs. Final report, 20:23092 (R;US)

WATER TREATMENT PLANTS
Case studies in residual use and energy conservation at wastewater treatment plants, 20:23805 (R;US)
Electrical/instrumentation acceptance test report for Project C-018H, 242-A Evaporator/PUREX Plant condensate treatment facility, 20:23259 (R;US)

WATER VAPOR
Comparisons of brightness temperature measurements and calculations obtained during the spectral radiance experiment, 20:24485 (RA;US)
Impact of cloud microphysics on the CSU GCM atmospheric moisture budget, 20:24452 (R;US)
Implementation of Raman lidar for profiling of atmospheric water vapor and aerosols at the Southern Great Plains Cloud and Radiation Testbed Site, 20:24481 (RA;US)
Long-pathlength infrared absorption measurements in the 8- to 14-μm atmospheric window: Self-broadening coefficient data, 20:24492 (RA;US)
Measurements and modeling of the effect of convective clouds on the upper tropospheric moisture budget, 20:24468 (RA;US)
Preliminary analysis of ground-based microwave and infrared radiance observations during the Pilot Radiation OBservation Experiment, 20:24516 (RA;US)
Scanning Raman lidar measurements of atmospheric water vapor and aerosols, 20:24478 (RA;US)
The water vapour continuum and its representation in ECHAM4, 20:24540 (R;DE)
Toward an operational water vapor remote sensing system using the global positioning system, 20:24484 (RA;US)

WATER WAVES
Near-surface current meter array measurements of internal gravity waves, 20:24010 (R;US)
Pencil beam radar selectivity of ocean wave spectra, 20:24640 (R;US)

WATERBORNE PARTICLES
See PARTICULATES

WATERFLOODING
An experimental and theoretical study to relate uncommon rock/fluid properties to oil recovery. Final report, 20:23070 (R;US)

An integrated study of the Grayburg/San Andres Reservoir, Foster and South Cowden Fields, Ector County, Texas. Quarterly technical progress report No. 3, February 1, 1995–April 30, 1995, 20:23062 (R;US)
Development of cost-effective surfactant flooding technology. Annual report for the period, September 30, 1993–September 29, 1994, 20:23075 (R;US)
Electrical and electromagnetic methods for reservoir description and process monitoring. Annual report, October 1, 1991–September 30, 1992, 20:23065 (R;US)
Improved oil recovery in fluvial dominated deltaic reservoirs of Kansas – near-term. Seventh quarterly report, February 1, 1995–April 1, 1995, 20:23083 (R;US)
The utilization of the microflora indigenous to and present in oil-bearing formations to selectively plug the more porous zones thereby increasing oil recovery during waterflooding. Annual report for the period, January 1, 1994–December 31, 1994, 20:23086 (R;US)

WATERSHEDS

WIND GENERATORS
See ELECTRIC GENERATORS
WIND TURBINES

WIND POWER
Probabilistic distributions of wind velocity for the evaluation of the wind power potential, 20:23501 (I;BR;In Portugese)

WIND POWER PLANTS
Avian use of proposed KENETECH and CARES wind farm sites in Klickitat County, Washington: Technical report. Appendix D, 20:23503 (R;US)
Climate-compatible energy supply in Baden-Wuerttemberg. Wind power utilisation, 20:23504 (I;DE;In German)
Columbia Wind Farm #1 EIS: Botanical resources technical report for the Conservation and Renewable Energy System. Appendix B, 20:23502 (R;US)

WIND TURBINE ARRAYS
A cultural resources study of the proposed CARES Columbia Wind Farm No. 1, Klickatat County, Washington. Appendix C, 20:23500 (R;US)

WIND TURBINES
A pilot golden eagle population study in the Altamont Pass Wind Resource Area, California, 20:23505 (R;US)
A simple method of estimating wind turbine blade fatigue at potential wind turbine sites, 20:23511 (R;US)
Advanced system identification techniques for wind turbine structures with special emphasis on modal parameters, 20:23508 (R;US)
Development of an advanced system identification technique for comparing ADAMS analytical results with modal test data for a MICON 65/13 wind turbine, 20:23510 (R;US)
EPA's adaptive controls system research program for pollution prevention and clean technologies, 20:24968 (RA;US)
Guidelines for reducing dynamic loads in two-bladed teetering-hub downwind wind turbines, 20:23509 (R;US)
Optimizing small wind turbine performance in battery charging applications, 20:23507 (R;US)
Wind power in Berlin, 20:23506 (I;DE;In German)

WINDOWS
High-power RF window and coupler development for the PEP-II B Factory, 20:24336 (R;US)
The harmonization of Canadian and U.S. window programs and standards. Final report, 20:23751 (R;US)

WIPP
Brine Sampling and Evaluation Program 1992–1993 report and summary of BSEP data since 1982, 20:23188 (R;US)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 3: Appendix BIR Volume 1, 20:23180 (R;US)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 7: Appendix GCR Volume 2, 20:23320 (R;US)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 5: Appendices D and D, DEF, FAC, 20:23343 (R;US)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 9: Appendices RM, SCR, SER, SUM, WRAC, 20:23322 (R;US)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 5: Appendices D and D, DEF, FAC, 20:23343 (R;US)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 6: Appendix GCR Volume 1, 20:23319 (R;US)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 8: Appendices HYDRO, IRD, LTM, NUTS, PAR, PMR, QAPD, RBP, 20:23321 (R;US)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 1, 20:23178 (R;US)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 2: Appendices, AAC, BECR, BH, 20:23179 (R;US)
Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 4: Appendix BIR Volume 2, 20:23181 (R;US)
Transuranic Waste Characterization Quality Assurance Program Plan, 20:23171 (R;US)

WISCONSIN
Development of feed-forward neural network models for gas short-term load forecasting, 20:23121 (RA;US)

WNP-2 REACTOR
Revised analyses of decommissioning for the reference boiling water reactor power station. Effects of current regulatory and other considerations on the financial assurance requirements of the decommissioning rule and on estimates of occupational radiation exposure: Appendices, draft report for comment. Volume 2, 20:23631 (R;US)
Revised analyses of decommissioning for the reference boiling water reactor power station. Effects of current regulatory and other considerations on the financial assurance requirements of the decommissioning rule and on estimates of occupational radiation exposure: Main report, draft report for comment. Volume 1, 20:23630 (R;US)
Revised analyses of decommissioning for the reference boiling water reactor power station. Effects of current regulatory and other considerations on the financial assurance requirements of the decommissioning rule and on estimates of occupational radiation exposure: Appendices, draft report for comment. Volume 2, 20:23631 (R;US)
Revised analyses of decommissioning for the reference boiling water reactor power station. Effects of current regulatory and other considerations on the financial assurance requirements of the decommissioning rule and on estimates of occupational radiation exposure: Main report, draft report for comment. Volume 1, 20:23630 (R;US)

WOMEN
Why so few young women in mathematics, science, and technology classes?, 20:23683 (R;US)

WOOD
Progress in the production of hot-gas filtered biocrude oil at NREL, 20:23426 (R;US)

WOOD ALCOHOL
See METHANOL

WOOD OILS
Progress in the production of hot-gas filtered biocrude oil at NREL, 20:23426 (R;US)

WORKERS
See PERSONNEL

WORKING (MATERIALS)
See MATERIALS WORKING

WORKING CONDITIONS
1994 Ergonomics Program Quality Evaluation, 20:24945 (R;US)

WWER TYPE REACTORS
Development and verification of a three-dimensional core model for WWR type reactors and its coupling with the accident code ATHLET. Final report, 20:23617 (R;DE;In German)

WYOMING
Naturally fractured tight gas reservoir detection optimization. Quarterly report, July–September 1994, 20:23110 (R;US)

X

X-2830 RESONANCES
See MESONS

X-RASERS
See X-RAY LASERS

X-RAY EQUIPMENT
Advanced source studies on laser produced plasmas for EUV lithography, 20:24396 (R;US)

X-RAY LASERS
Inner-shell photo-ionized X-ray laser schemes for low-Z elements, 20:24835 (R;US)
Theory of recombination x-ray lasers based on optical-field ionization, 20:24050 (R;US)

XENON
Numerical predictions of the separation of heavy components inside the trace gas concentrator, 20:23942 (R;US)

XYLANASE
The hemicellulases from the ethanologenic thermophile, Thermoanaerobacter ethanolicus and similar anaerobic thermophiles. Annual technical progress report, 20:23422 (R;US)

XYLANASES
See XYLANASE

Y

Y-12 PLANT
Adjusting external doses from the ORNL and Y-12 facilities for the Oak Ridge Nuclear Facilities mortality study, 20:24724 (R;US)
Data collection, validation, and description for the Oak Ridge nuclear facilities mortality study, 20:23362 (R;US)
Environmental restoration risk-based prioritization work package planning and risk ranking methodology. Revision 2, 20:23357 (R;US)
Refurbish power supply/distribution system Phase II. Progress status report No. 43, March 1, 1995–March 31, 1995, 20:23655 (R;US)

YANKEE EVENT
See NUCLEAR EXPLOSIONS

YTTERBIUM 174 TARGET
Decay of the ^{194}Pb superdeformed band, 20:24813 (R;US)

YTTRIUM ALUMINIUM GARNETS
See ALUMINIUM OXIDES

YTTRIUM OXIDES
A method for measuring non-linear elastic properties of thermal barrier coatings, 20:23889 (R;US)

YUCCA MOUNTAIN
Corrosion of candidate materials in Lake Rotokawa geothermal exposure, 20:23930 (R;US)
Creep in Topopah Spring Member welded tuff. Yucca Mountain Site Characterization Project, 20:23332 (R;US)
FY94 CAG trip reports, CAG memos and other products: Volume 2. Final report, 20:23209 (R;US)
Formulation and numerical analysis of nonisothermal multiphase flow in porous media, 20:23237 (R;US)
Long-term test results from a West Valley actinide-doped reference glass, 20:23163 (R;US)
Nevada potential repository preliminary transportation strategy: Study 1, 20:23326 (R;US)
Office of Civilian Radioactive Waste Management Fiscal Year 1994 annual report to Congress, 20:23187 (R;US)
Selection of a preferred initial access for the exploratory studies facility, 20:23207 (R;US)
Site environmental report for calendar year 1994, Yucca Mountain Site, Nye County, Nevada., 20:23327 (R;US)
Yucca Mountain Site Characterization Project technical data catalog quarterly supplement, 20:23185 (R;US)

Z

ZEA MAYS
See MAIZE

ZERO POWER REACTORS
See also GODIVA REACTOR
JEZEBEL REACTOR
A small graphite-reflected UO_2 assembly, 20:23594 (R;US)
Calculated in-air leakage spectra and power levels for the ANSI standard minimum accident of concern. Final report, 20:23130 (R;US)

ZHURAVLEV PROCESS
See COAL GASIFICATION

ZINC
Oil production enhancement through a standardized brine treatment. Final report, 20:23101 (R;US)
Recycling zinc by dezincing steel scrap, 20:23773 (R;US)

ZINC HALIDE PROCESS
See COAL LIQUEFACTION

ZINC SELENIDES
New infrared solid state laser materials for CALIOPE, 20:24008 (R;US)
Nucleation, propagation, electronic levels and elimination of misfit dislocations in III-V semiconductor interfaces. Final report, September 1, 1986–August 31, 1993, 20:23910 (R;US)
Properties of transition metal-doped zinc chalcogenide crystals for tunable IR laser radiation, 20:23933 (R;US)

ZINC SULFIDES
New infrared solid state laser materials for CALIOPE, 20:24008 (R;US)
Properties of transition metal-doped zinc chalcogenide crystals for tunable IR laser radiation, 20:23933 (R;US)

ZINC TELLURIDES
New infrared solid state laser materials for CALIOPE, 20:24008 (R;US)
Properties of transition metal-doped zinc chalcogenide crystals for tunable IR laser radiation, 20:23933 (R;US)

ZINC-AIR BATTERIES
A refuelable zinc/air battery for fleet electric vehicle propulsion, 20:23816 (R;US)

ZIRCONIUM
Corrosion fatigue behavior of zirconium in boiling nitric acid, 20:23858 (R;JP;In Japanese)
Research on fretting corrosion behavior of structural materials used in nitric acid environments for spent fuel reprocessing . 2. Effect of nitric acid temperature on fretting corrosion behavior of zirconium, 20:23857 (R;JP;In Japanese)
Research on fretting corrosion behavior of structural materials used in nitric acid environments for spent fuel reprocessing. 1. Difference in fretting corrosion resistance among austenitic stainless steel, Ti and Zr, 20:23140 (R;JP;In Japanese)

ZIRCONIUM CARBIDES
Review of experimental studies of zirconium carbide coated fuel particles for high temperature gas-cooled reactors, 20:23552 (R;JP)

ZIRCONIUM OXIDES
A method for measuring non-linear elastic properties of thermal barrier coatings, 20:23889 (R;US)
Low severity upgrading of F-T waxes with solid superacids. Quarterly report, January 1995–March 1995, 20:22991 (R;US)
Mechanical behaviour during sintering - diffusion models and their verification for ZrO_2, 20:23892 (R;DE;In German)
Sintering of ceramics using low frequency rf power, 20:23886 (R;US)

Contract Number Index

Numbers assigned to DOE contracts announced in documents in this publication are listed. Contract numbers are sorted alphanumerically and list the primary corporate author of the document cited, the citation number, and the report number or other document identification.

Contract No.	Abstract No.	Report No.
AC01-87EH79003	**NUS Corp., Gaithersburg, MD (United States)**

Report Number Index

The report number index consists of the alphanumeric identifiers assigned to report literature as well as patent and conference literature cited in this publication. Entries provide the abstract number; the source(s) of availability of the document; the GPO file prefix for GPO depository library documents; the order number for OSTI and NTIS report ordering purposes; and, if the document was distributed under the DOE distribution program, the category number is shown for paper copy (PC), microfiche (MF), or no distribution (ND). These categories are included to assist DOE librarians in responding to requests for reports in their collections. The index also lists secondary numbers, with the corresponding abstract numbers and cross-references to other identifying numbers.

Report Number	*Abstract Number*	*Source of Availability*	*GPO Dep.*	*Order Number*	*Distribution Category*

ORDER FORM

DOE and DOE Contractors: Fill in Parts I, II, and IV. **Others:** Fill in Parts I, III, and IV. Mark appropriate blanks in Part IV to indicate quantity and form (microfiche or paper copy).

I. SHIPPING AND PAYMENT INFORMATION

Ordering Address

Name _____ Telephone _____

Address _____

City _____ State _____ Zip _____

Shipping Address (if different from above)

Name _____

Address _____

City _____ State _____ Zip _____

_____

SIGNATURE (Required to validate ALL orders)

II. OSTI ORDERS (DOE and DOE contractors can order from OSTI.)

☐ Charge OSTI deposit account no. _____

☐ Charge to my ☐ VISA ☐ Mastercard

_____ _____

Account Number **Card expiration date**

Mail orders to: U.S. Department of Energy
Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, TN 37831

III. NTIS ORDERS

☐ Charge NTIS deposit account no. _____

☐ Check/Money Order enclosed for $ _____

☐ Charge to my ☐ American Express ☐ VISA ☐ Mastercard

_____ _____

Account Number **Card expiration date**

☐ Ship and Bill (see below for restrictions) _ _ _ _ _ _ _ _ _

Employer identification number (9 digits) —

Purchase Order number _____

Phone number of billing office _____
(Required for Ship & Bill orders)

Ship & Bill service is restricted to North American business locations for an extra $7.50 per order (or per Custom Search). The business' employer identification number plus the phone number of the office paying the bill are required to process these requests. A late payment charge will be applied to billings more than 30 days overdue. Prepaying, using an NTIS Deposit Account or a charge account, speeds order processing. Be sure payment and order are sent together. Checks, payable to NTIS, must be in U.S. dollars.

Mail orders to: U.S. Department of Commerce
Technology Administration
National Technical Information Service
Springfield, VA 22161

IF NO METHOD OF PAYMENT IS INDICATED, YOUR ORDER WILL BE RETURNED TO YOU AS A PRICE QUOTE UNPROCESSED.

IV. SELECTIONS

Order number _____ Report number _____

Abstract number (with vol., issue) _____

No. of fiche _____ No. of paper copies _____

Order number _____ Report number _____

Abstract number (with vol., issue) _____

No. of fiche _____ No. of paper copies _____

Order number _____ Report number _____

Federal Depository Library Program

As a result of an agreement between the U.S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are not sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
